MONTEVIDEO, URUGUAY, Jan. 1—The European war continues to keep the European automobile entirely out of the Uruguay market. The summer season, which is just passing, has been a very satisfactory one for the sale of cars here. Ford leads in the number sold and the increase in the use of them is nothing short of amazing, as buyers almost stand in line with cash in hand waiting to get their turn at buying. Over 1500 Fords have been sold this year, and now nearly every other car seen in the country is a Ford. The sale of Studebakers, both four and six-cylinder models, by Coates Bros., has been good, and now these machines are seen all over the Republic. Cadillacs have sold in greater quantities than any other high-priced cars. The Dodge has made strong progress since introduced here 2 years ago. Buicks, Maxwells and Overlands are doing well in this market.

Up to the present the motor truck is scarcely known in Uruguay so far as the country is concerned, although there are goodly numbers of them in Montevideo with its population of 375,000. Labor shortage is what this country is facing at present, and is going to face for several years, and this is going to make a market for the motor truck.

Farm tractors are scarcely more than heard of in Uruguay, although several dealers here believe that if they had an opportunity of visiting a demonstration in U. S. A., which would give them a definite line on tractor performance, that they would be able to make good sales to the farmers of Uruguay. Population is what is needed more than anything else in the farming sections of Uruguay, and the farm tractor should be the one effective means of making up for labor shortage. The shortage of mechanical help is one of the great handicaps to the truck and tractor.

Complaints are heard too frequently in Montevideo concerning extortionate shipping rates which are exacted by exporters in the U. S. A. To quote the exact words of one Montevideo automobile dealer, he says: "You will find cars on the same steamer for which shipping rates are at the rate of 67½ cents per cubic foot, $1.20 per cubic foot, $1.80 per cubic foot and even $2 per cubic foot. I guess the steamer all the way through gets about the same 50 cents per cubic foot rate and the balance goes to the forwarding pirates. It is all right so long as the United States has a literal monopoly because of war conditions, but give us 10 minutes' peace conditions and sooner than buy the Yankee car which we want, and for which we are soaked on the ocean shipment, we will buy the European car we do not want, but on which we get a square deal on ocean shipments. American manufacturers apparently do not realize that this is a detail of importance."

There should not be any difficulty in having this abuse remedied. Could it not be stopped in 10 minutes by the custom's port authorities refusing clearance to any steamer not endorsing on each bill of lading the exact freight collected for the carriage or transportation of that particular parcel of goods? The result would be that the Montevideo dealer would know exactly what shipping rates were paid.

—

Osborne Working for Industrial Peace

WASHINGTON, March 2—Loyall A. Osborne, New York, vice-president of the Westinghouse Electric & Mfg. Co., and chairman of the executive committee of the National Industrial Conference Board, has been appointed by the Secretary of Labor a member of a committee on industrial peace during the war. This committee, which consists of five representatives of employers, five labor leaders and two others, will provide a definite labor program for industrial peace during the war to prevent interruption of production.

—

Optician Shop Trucks for France

WASHINGTON, March 3—Motor trucks will perform a new service in France. Various makes of 5-ton military trucks are being equipped with complete shops to manufacture lenses for spectacles for our soldiers. The trucks will operate within 15 to 50 miles of the front lines and will make glasses for every soldier requiring them. Stocks of optical glass and the parts of spectacles and nose-pieces will be maintained at base depots in large quantities and will be carried on board the trucks in such amounts as can be handled. The trucks will be equipped with cabinets for holding the stock, machines for grinding lenses, producing spherical surfaces, automatic and hand-operated edge-grinding machines, tools, gauges, etc. There will be two drivers and two optical repairmen on each truck.

—

Complaints Against Paint Makers

WASHINGTON, March 2—The Federal Trade Commission to-day authorized the issuance of complaints charging thirty-eight paint, varnish, soap and ink concerns with various unfair methods of competition in violation of Section 5 of the Federal Trade Commission Act. This is the largest number of complaints ever acted on at one time. The complaints allege the concerns stifle and suppress competition through lavish entertainment of competitors' employees, secret payment of money to employees of customers who might otherwise buy goods from competing concerns, and in one instance the respondent is charged with the adulteration of competitors' goods. The firms named in the complaints are given the usual 30 days to reply, and have been notified that the commission will hold a hearing on all complaints in question on the morning of April 8 next.

Favor U. S. Tractors in Europe

Italy, Switzerland, New Zealand and South Africa Buying American Products

WASHINGTON, March 5—American tractors are gaining ground abroad, according to reports received by the Department of Commerce from consuls in various cities of Switzerland, Italy, New Zealand and South Africa. Tractor manufacturers are paying more attention to the foreign field, and are eliminating features of mechanism objected to in Europe.

This is especially true in Italy. Several Italian rice cultivators have stated that they did not consider American tractors suitable for the requirements of the uneven Piedmontese land. A well-known American company, after careful study, changed its tractor so as to eliminate the features which had militated against the successful operation of the tractor in Piedmont. At present Italian rice cultivators are appreciative of American products.

As a first step to increased trade in Italy, tractor manufacturers should issue circulars in Italian for distribution among farmers there.

During the war the Swiss peasant has been paying more attention than previously to American agricultural machinery. Trials of American motor plows were recently undertaken by the Zuckerfabrik Aarberg, Aarberg, Switzerland, and by the Landwirtschaftliche Schule Rutti bei Berne, Switzerland. The results favorably impressed the various experts of the agricultural associations.

In South Africa, imports are being curtailed with a view to conserving all available shipping space for necessaries. Nevertheless, American products are easily obtained, and a good foundation for future trade should be established. Medium sized tractors with good power, which can be utilized for traction plowing, operate successfully. The tractor should be easy to operate and as nearly foolproof as possible. Purchasers should be thoroughly instructed in the use of the tractor, and spare parts should be easily obtainable.

Great care should be taken in granting exclusive agency rights. Importing dealers in agricultural machinery and implements are usually the most satisfactory representatives, as they generally have various branches or connections and have an established trade in farming communities.

Reports from New Zealand state that the demand for tractors is not large at present, but that a good market could readily be developed. The district is flat, and most of the grain is grown here. Traction engines from the United States are taxed 10 per cent. In order to obtain a footing, it would be necessary either to open a branch or grant an exclusive agency to some established firm.

Digitized by Google

Export Regulations Altered

WASHINGTON, March 2—Following the report of the War Trade Board 2 weeks ago, AUTOMOTIVE INDUSTRIES published a statement to the effect that collectors of customs would accept a shipper's export declarations in lieu of an individual license, for all goods which had not required licenses prior to the President's recent export and import proclamation. This was under the provision that it be shown to the satisfaction of the collectors that the goods were covered either by a bill of lading marked "for export," or a through export bill of lading, provided the bill of lading was dated Feb. 19, 1918, or earlier and provided that the goods were actually exported by March 15th. The War Trade Board assumed when it made this statement that all exporters interested in above described shipments would immediately apply for export licenses and receive them in ample time to be used on or before March 15, 1918.

The War Trade Board now says that there is at present a considerable congestion of freight at various points which will make it impossible for all goods covered by the above ruling to be exported on or before March 15, 1918. To take care of the situation the Board has adopted the following form of procedure to be used in those cases where the goods, which did not need a license prior to the proclamation, are covered by either a bill of lading marked "for export" or a through bill of lading dated February 19, 1918 or earlier.

Any exporter or shipper interested in shipments of this character which are not to be exported by March 15. 1918 should present his export declarations in quadruplicate, under Form Customs Catalog No. 7525, to the nearest branch office of the War Trade Board. This branch office will license the shipments on the export declaration without requiring the shipper or exporter to file a formal application.

These export declarations when licensed will be of use only if the goods are exported by April 15, 1918. If any shipper or exporter has reason to believe his shipment will not be exported by this date, he has several weeks within which to file a formal application and receive a license valid for the usual period.

Shippers should not wait until July 15 to file formal application if shipments cannot be exported before that date. The application should be filed immediately, to fully protect the shipper if the formal license becomes necessary later.

—

Tractors Shown at Columbus Show

COLUMBUS, OHIO, March 2—The Ninth Annual Columbus Automobile Show which opened Feb. 27, at Memorial Hall, included farm tractors as well as passenger cars. Because of lack of space, no motor trucks were shown. An unusually large crowd attended the show, on the opening night, and several sales were reported. Passenger cars and tractors were exhibited on the main floor, and accessory dealers and manufacturers had booths in the balcony. The show was held under the auspices of the Columbus Automobile Show Co., a corporation composed of several Columbus dealers.

—

Thayer on Aircraft Board

WASHINGTON, March 2—Harry B. Thayer, New York, has been appointed a member of the Aircraft Production Board by President Wilson.

Need Workers for Ordnance Department

WASHINGTON, March 4—The Ordnance Department of the United States Army has issued a call for civilian workers with a high school education and some shop training. Applicants will receive the necessary training under government instruction, and will receive appointments as soon as this short course of training is finished. Those who have the required technical training will be assigned to ordnance work immediately in the following positions:

Inspectors and assistant inspectors, field artillery ammunition steel.
Inspectors, artillery ammunition, cartridge cases, assembling, loading, forging, primers, detonators, shell and shrapnel machining.
Ballistic inspectors.
Metallurgical chemists and assistants.
Inspectors, powder and explosives.
Inspectors, cannon, forging operations.
Inspectors, gun carriages and parts.
Inspectors, gun fire control instruments.
Assistant inspectors, motor vehicles and artillery wheels.
Engineers and assistant engineers for tests of ordnance materials.
Inspectors, ammunition packing boxes.
Machinists accustomed to work to 1000ths of inch.

Applications should be mailed to C. V. Meserole, special representative of the Ordnance Department, U. S. A., Room 800, 79 Wall Street, New York City.

—

Recommend Daylight Saving Bill

WASHINGTON, March 4—The United States Chamber of Commerce, through its committee on daylight saving, recommended the prompt passage by Congress of the Daylight Saving Bill. Fifty-two important reasons were given in the recommendation.

Calendar

ASSOCIATIONS

April 15-19—Little Rock, Ark., United States Good Roads Assn. Sixth Annual Session.

RAYFIELD THERMOSTAT

Here it is at last

A hot motor all the time

Stops your motor troubles

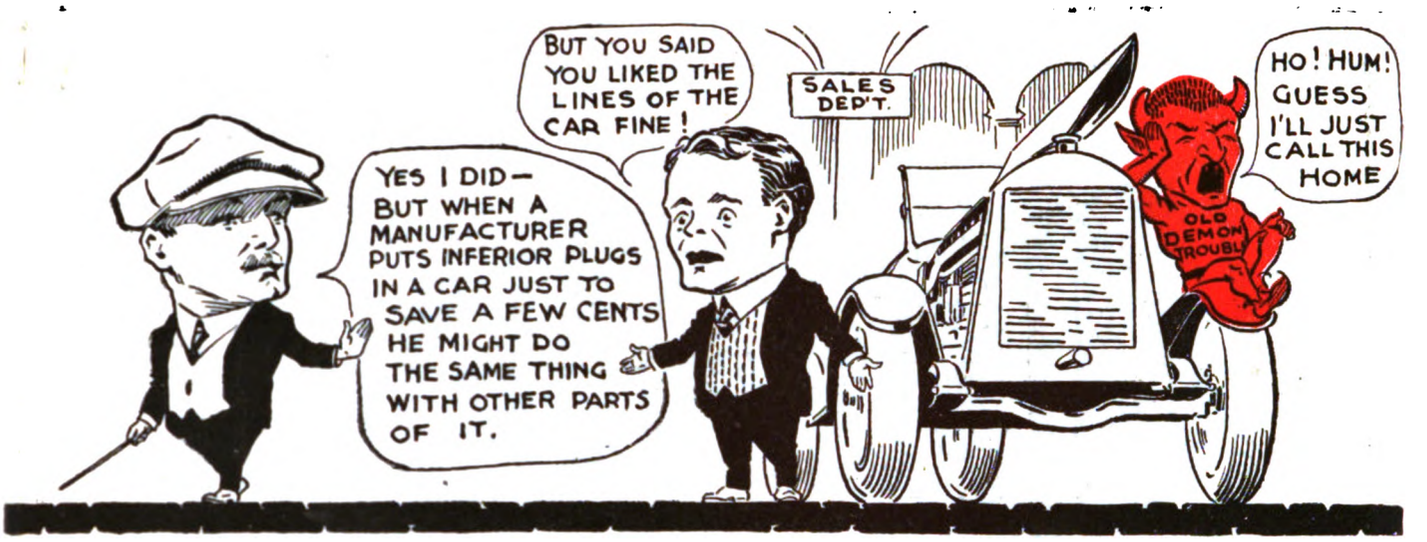
CAR, truck and tractor owners have been awaiting such a device ever since the advent of low-grade fuel—a device that would insure instantaneous, constant and efficient heat in the motor. The Rayfield Thermostat does it. No matter how cold the water in the radiator, and no matter whether the temperature be 30 below zero or 100 above in the shade; your motor will retain an even, efficient heat.

The Rayfield Thermostat is easily installed on a pleasure car, truck or tractor, using any make or type of carburetor. In a short time it will save its cost in fuel, oil and repair bills. It insures perfect combustion and forestalls trouble arising from unconsumed fuel. You have a better performing motor all the time. This new device is simple, durable, and requires no adjustments or attention whatever. Once used it becomes a necessity in summer as well as winter.

The Rayfield Thermostat is made by the makers of the famous Rayfield Carburetor.

Investigate this new device. Ask your dealer. If he can't supply you, write us.

Prompt deliveries on Rayfield Carburetors



We have heen swamped with orders for Rayfield Carburetors. Often in the past we were unable to supply the demand. Now, however, due to increased production facilities, we can guarantee immediate delivery on all carburetor orders.

Moreover, the Rayfield Carburetor has been brought to a point of greater perfection today than ever heretofore.

Now is the time to have a Rayfield installed on your car.

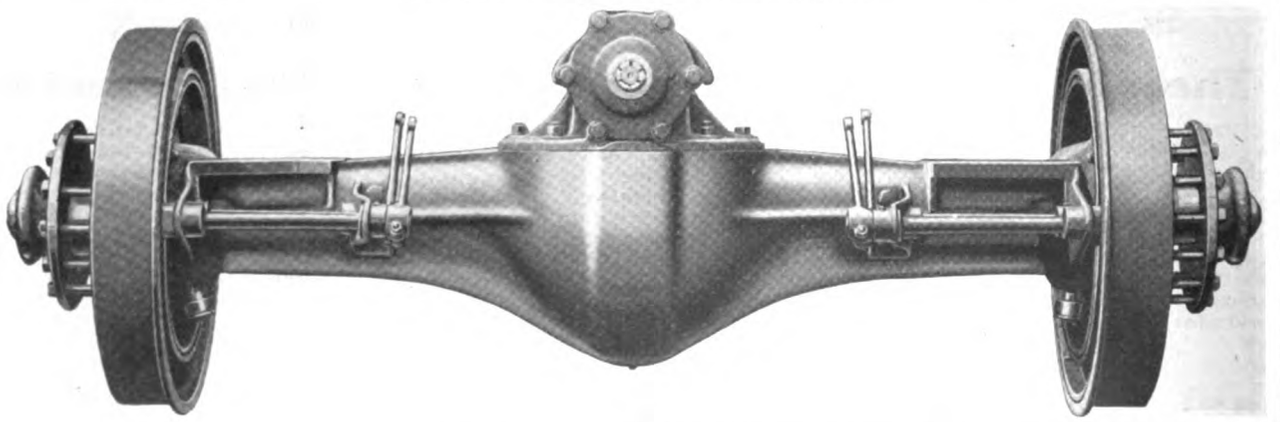
WISCONSIN AXLE

WORM DRIVE

Ordered Now May Prevent A Shortage Later

No one knows how long you will be able to get worm drive axles, or how many will be available during the course of 1918.

Right now, WISCONSIN Worm Drive Axles are ready for immediate delivery, in the quantities you want. We have increased our facilities to accommodate you—and a few other truck manufacturers, foresighted and business-wise.



Your order placed while we are in position to deliver is protection against a possible shortage in the future. Delay, in the face of conditions, changing from day to day, may find you curtailing your output later in 1918.

Ten other truck manufacturers are certain of their 1918 supply of Wisconsin Axles. Let us show you what they think of our product and service.

REVERE

A limited number of inventions succeed. They are the inventions of practical theorists—of men who know and know how.

A limited number of motor cars succeed. They are the motor cars that dominate—designed by men who know and know how.

Gil Anderson is a race driver, but he is also a motorist like yourself. He knows the mechanics of motor cars that win, and the requirements of passenger cars that make good.

You would select the Revere—designed by Gil Anderson, Adolph Monsen and Tom Rooney—from a group of many motor cars. It combines the accessibility, so essential in the racer, with refinements and design that make a few passenger cars a notable success.

For a select number of big calibre dealers in the larger population centers, the Revere offers a connection of unusual possibilities.

Write or wire for complete information, as limited output for 1918 makes early alliances essential.

Distinctive Specifications

Duesenberg Racing Type Motor—speed from 4 to 85 miles an hour; 130-in. wheelbase; 4 speeds forward and 1 reverse; Bosch Magneto; Bijur Electric System; Special Revere design Drop Forged Front Axle; Special Revere design Springs; Miller or Stromberg Carburetor; Goodyear Cord Tires. All Standard Body Sizes, Revere Designs.

Last Call for 5% Extra Profit

Special Offer Ends March 15th

A Volume for every Section

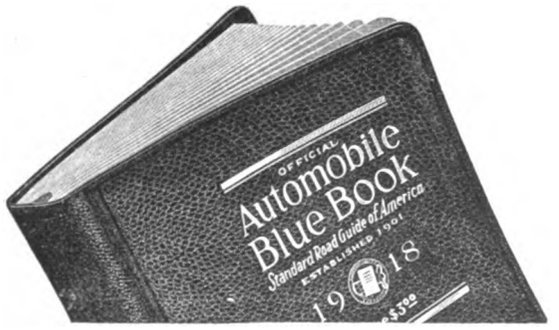
Price $3.00 per Volume

This is your last opportunity

to make a 5% better profit on this standard piece of merchandise—the Automobile Blue Books

Every car owner who tours knows the Automobile Blue Books. For seventeen years they have been known as the Standard Road Guides of America. That is the reason they are such a popular annual seller and a profitable article to push.

By placing your order before March 15th, helping us to determine how many to print of the various volumes, you can have an additional extra 5% discount on your order. Books will be published May 1st, but your order must be in our hands not later than March 15th.



Here is the profit you will make on every copy if you order before March 15th:

$1.00½ on every copy if you order 1 to 6 copies (33⅓%)
$1.10 on every copy if you order 7 to 24 copies (36⅔%)
$1.14¾ on every copy if you order 25 to 49 copies (38¼%)
$1.19½ on every copy if you order 50 to 99 copies (39.8%)
$1.24¼ on every copy if you order 100 to 249 copies (41.4%)
$1.29 on every copy if you order 250 or more copies (43%)

Terms—2% 10 days or 30 days net

This is 5% better than our regular schedule—the schedule at which all orders will be billed that are received after March 15th. If you delay placing your order you will deprive yourself of an extra 5% profit on this standard merchandise that you can have if you act now. This means a difference of from 9 to 10½ cents on every copy.

The above discounts are for books f.o.b. New York, Chicago or San Francisco. Delivery will be made from nearest point. Every order determines its discount. Discount on initial order does not hold good on repeat orders.

Mail your order now to your jobber or direct to

MARMON 34

The New Series—Stabilized Design

It seems a contradiction, but it is no less a fact, that the new series Marmon 34, while bringing no radical changes—no fundamental innovations—does establish a most noteworthy fundamental in motor car construction — namely, Stabilized Design.

WHEN the Marmon 34 was introduced at the New York Automobile Show two years ago, it differed entirely in principle and design from all other cars.

For one thing, it was 1100 pounds lighter. For another, it eliminated more than 1200 parts. Aluminum was extensively used in the motor and body. The frame, running-boards, and fenders were a rigid unit construction. Great engineering genius has not been able to better it except in the matter of a few mechanical refinements.

So today the distinguishing differences between the New Series Marmon 34 and the old are the slanting windshield and the wider seats and the deeper sides.

As far as men know, the Marmon represents the final type. It has put a stop to the annual metamorphosis of models—it has stabilized not only construction, but the buyer's investment.

NORDYKE & MARMON COMPANY

Established 1851 : Indianapolis

Digitized by Google

MARMON 34

Advanced Engineering

A Stabilized Market

TAKE a survey of the automobile field and you will note that certain cars possess certain strong individuality—they represent types.

For example: The car that stands for a very low price. A second that is recognized for a certain type of motor. Or a third that is known for another important idea.

Among these steady sellers looms the Marmon 34—leader of the fine car group, the exponent of stabilized design.

It represents advanced engineering—eleven hundred pounds less weight—minimum unsprung weight—perfect balance, front and rear—twelve hundred and ninety less parts—automatic lubrication—roadability at all speeds—long wheelbase with short turning radius and 50 to 75 percent more miles per gallon of fuel than cars of like size and power.

These and other great distinctions have made the Marmon come to typify the thing men want. Its success has grown steadily day by day ever since its introduction three years ago.

And the dealers who depend upon it for their business know that the Marmon's stabilized design has brought a stabilized market.

DETROIT TRANSMISSIONS

DETROIT GEAR & MACHINE CO.

MODEL C TRANSMISSION

Unit Power Plant Type for Trucks of 1, 1½ and 2-Ton Capacity—3 Speeds

A sturdy truck transmission that has proven its value by five years of service in the product of half a dozen of the best truck manufacturers in the country. It is furnished with clutch housing to fit motors requiring a No. 3 or No. 4 S. A. E. standard flange, also to fit the Model N and 7-N Continental Motor flange. We can either furnish the 12-plate Model "G" disc clutch shown above or can make provision for Borg & Beck 12 inch clutch.

Gears are 6-8 pitch, ¾" width face, made from drop forged, heat treated high carbon 3½% nickel steel. Countershaft and gears are one solid forging, running on ball bearings. Gear ratios are as follows:

High—Direct Second—1¼ to 1 Low—3.2 to 1 Reverse—3.88 to 1 Weight with clutch, 162 lbs.

The countershaft may be extended as shown, at the purchaser's option, to provide for power takeoff, or Wood's Hoist attachment can be applied to tire pump boss shown on side in view of CX transmission.

A model that can be used interchangeably by manufacturers having two models of 1, 1½ or 2-ton capacity that prefer unit power plant construction.

For tractor use a modification of this transmission is finished having direct drive on second speed. Other gear ratios are:

First Speed—1.565 to 1 Third Speed—1 to 1.72 Reverse—1.9 to 1

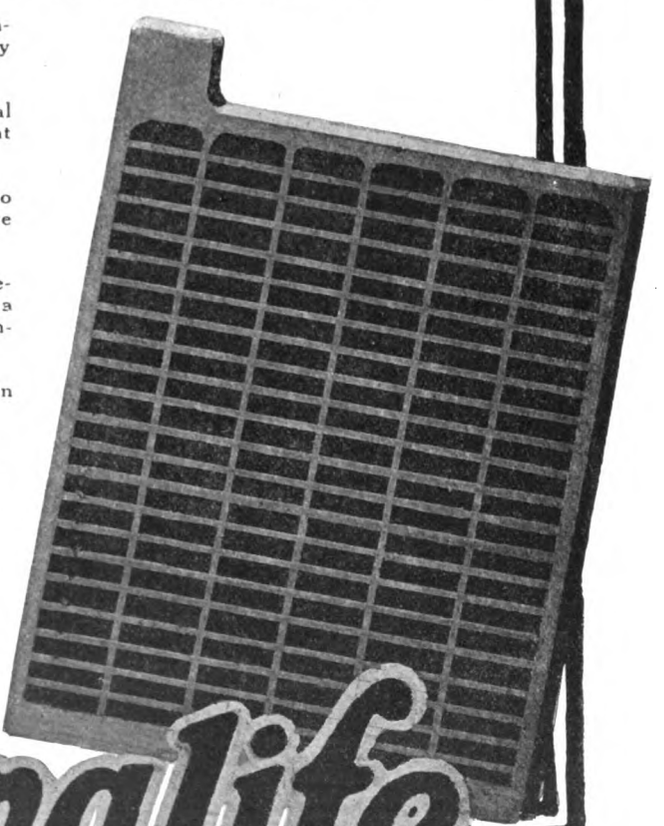
Permalife Plates Cannot Buckle

No Permalife plate ever did buckle. The vital importance of this Permalife feature is evidenced by the fact that 75% of all battery trouble is caused by buckling or bending plates.

NOTHING in the Permalife Battery receives greater attention than the plates. From the first, Wright, the Permalife inventor, saw clearly that herein lay the dominant requisite for the best service, and he gave long, intensive effort to this one feature. How well he succeeded is shown in Permalife performance.

The Permalife grid has a special bend resisting construction which braces it and keeps it straight in every direction against every strain.

Then to give added strength—the active material is packed by hand (not pasted) in such a manner that it is locked in and cannot loosen.



The active material is of such permanence as to give great durability and yet so porous as to facilitate the quick chemical action of the electrolyte.

Permalife Separators are made of the most carefully selected wood—quarter sawed and treated to a process of electrical sifting to eliminate any conductive material.

Permalife delivers a higher rate of discharge than any other make.

Write for the Permalife Merchandising Plan—it presents a co-operative proposal by which the dealer is able to gain and hold the bulk of local battery business.

To Eastern Dealers:

THIS IS YOUR OPPORTUNITY TO MAKE 1918 A YEAR OF PROFITS

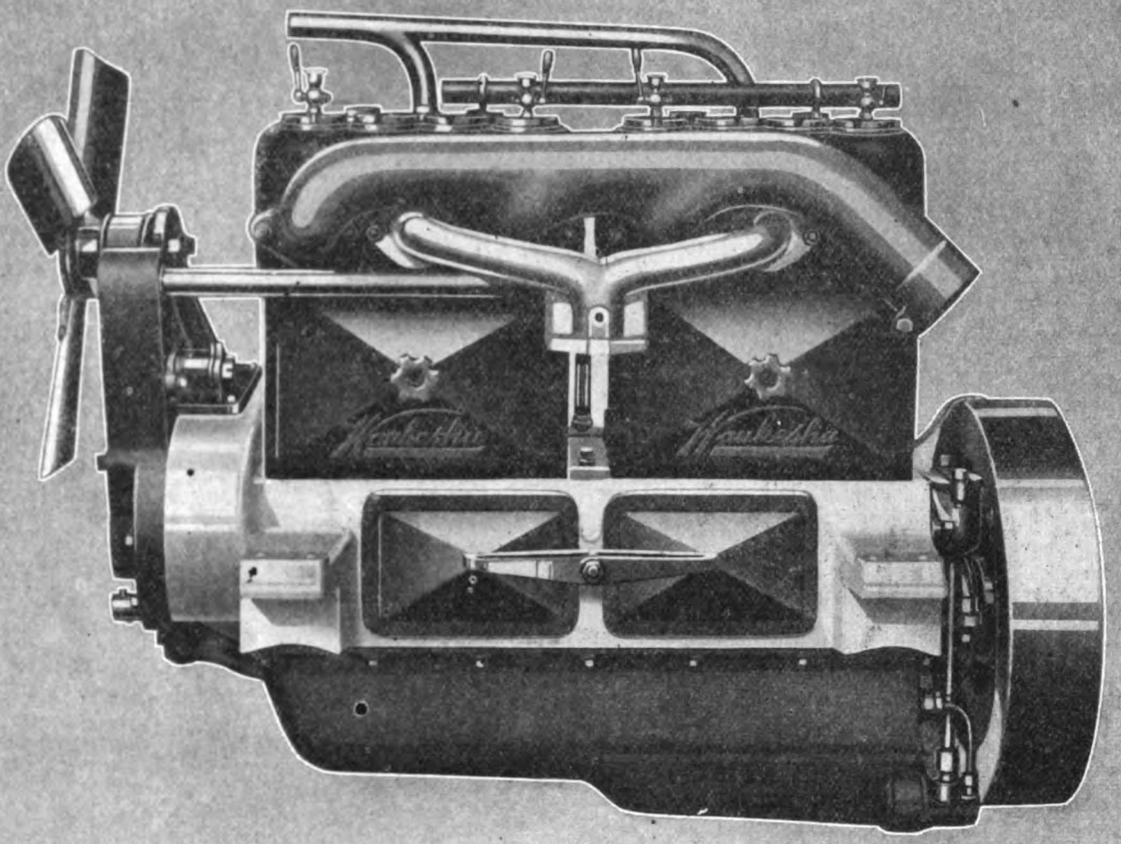
Louis Chevrolet says-

Every American bears the personal O.K. of Louis Chevrolet. You find it on the inside of the dash just below the name-plate, when you raise the hood, in Chevrolet's own hand —"O.K., Chevrolet."

You can see the handwriting on the wall. You know it will not be a question of MAKING sales this season—**But of getting cars to meet the demand.**

The demand for cars this year will be as great as it ever has been—but between greatly reduced output on the part of manufacturers on the one hand and traffic conditions on the other, no Eastern dealer will be able to secure his full allotment of cars. Many will get **none at all.**

But AMERICAN dealers are going to have all the cars they can sell—**as fast** as they can sell them. This is **positively guaranteed**—because we are not affected either by freight tie-ups or government contracts. The AMERICAN plant, located at Plainfield, New Jersey—is within driving distance of practically every Eastern locality.



You can see how profitable it will be to have the AMERICAN in your territory. It is a car with all the attributes and appurtenances of the more expensive makes—a car endowed with a dignity of beauty and inherent qualities of goodness that will appeal to you. You can push it with the sure knowledge that every one you sell will make a staunch friend for it and for you.

This is a real opportunity for Eastern dealers to make 1918 a record-breaker for profits. Write or wire us today for detailed specifications and liberal dealer proposition.

The Height of Lens Development

THE Dillon Multi-Vision Lens marks a new era in lens performance. Not only is it a radical departure in design, but it is evolutionary in results.

The central bull's-eye, for instance, is an exclusive advantage of the Dillon. This bull's-eye has an important function—that of concentrating and magnifying the light on the road. This light is made glareless by the light from a carefully determined proportion of clear glass above the bull's-eye. The clear glass at the bottom provides the necessary front and side lighting.

The Dillon is the only lens made that gives you TWICE the lighted area, by projecting a SQUARE path of light. It is also the only lens made that projects entirely beyond the rim.

In no respect is the Dillon excelled and any of its chief features alone make it supreme in its field.

Write for literature, or send cash, check or money order, together with make and model of your car if you cannot obtain Dillon Lenses.

SERVICE

Service in a Motor Truck Means This:

SERVICE is measured by the length of time for which any mechanical unit will continue to do the greatest amount of work with the least amount of trouble.

The Sheldon Worm Drive Rear Axle ***improves with use.*** The longer you use it, the better it serves you—right up to the point of final destruction.

It is strongly protected against trouble—of any kind. And if it ***should*** sustain injury by some unavoidable accident, it is quickly and easily repaired.

It is simply designed and powerfully constructed of quality material by men whose years of training have given them a skill far beyond the ordinary.

Its record for long, unbroken, efficient service under grinding work of the hardest possible character has won for the Sheldon Worm Drive Axle first place in the opinion of those whose business demands just such service.

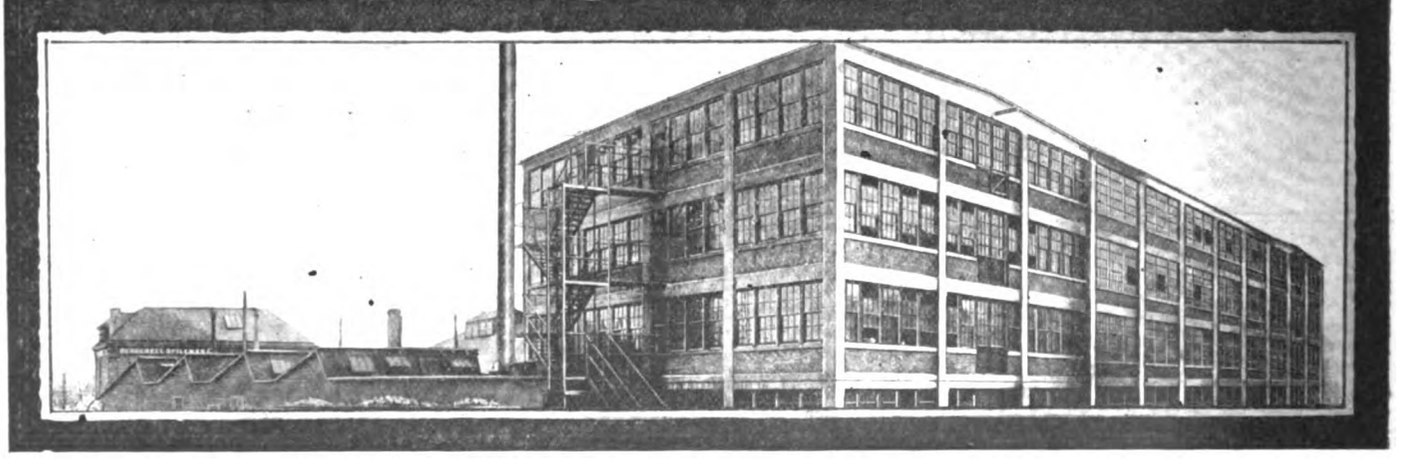
SPILLMAN "8"

Special Advantages

1. A lubrication system superior to all others.
2. A cooling system of the highest efficiency.
3. Unusual accessibility of parts.
4. An even, constant supply of fuel equally to both blocks of the motor.
5. A design that is not an experiment but a proved certainty.

THE SPILLMAN "8"



is offered as the most efficient and most highly developed 8-cylinder motor on the market. Accessibility, lubrication, cooling and fuel supply — the four big requirements — are squarely and efficiently met in the SPILLMAN.

Leading 8-cylinder cars are SPILLMAN equipped, and their motors are among their very best selling points.

Built for Sturdy Service

Rugged endurance is built into every Mason Tire that leaves our factory. Every step in the making of Masons compounds sturdy service with perfect resiliency.

It's the sort of tire you want for every day service—the consistent, long-lasting tire that sells at a popular price. Equip your spare rim with a Mason. As soon as it goes into service it will prove Mason quality.

1918 Will Be a Mason Dealers Year

With prices of everything so high, motorists appreciate popular priced quality more than ever. Mason reputation is established. And Mason dealers will reap a rich harvest from the demand for Mason Tires this year.

A line to the factory will bring you a mighty interesting dealer's offer

BOYCE MOTO-METER

DISTANCE TYPE

For aeroplanes, tractors, stationary engines and motor boats.

BETTER BECAUSE—

FIRST, it registers the full scale of 32° to 212°. This is important. (Others from 100° to 212° only.)

SECOND, no gears, direct movement of the pointer. (All others built with an unreliable 15 to 1 gear movement.)

THIRD, smooth, unbroken, non-vibrating movement of the hand. (Others are unreadable under vibrations.)

FOURTH, remains accurate up to 25,000 feet altitude. (Others read 5 to 19 degrees *inaccurate*.)

FIFTH, weight with 12 feet of tubing only 12 ounces.

There Is Only One Reliable Motor Heat Indicator. The Name "Boyce" Is Your Guarantee

May we ask you to compare this instrument with others before ordering your requirements? Don't pay more for a less reliable instrument.

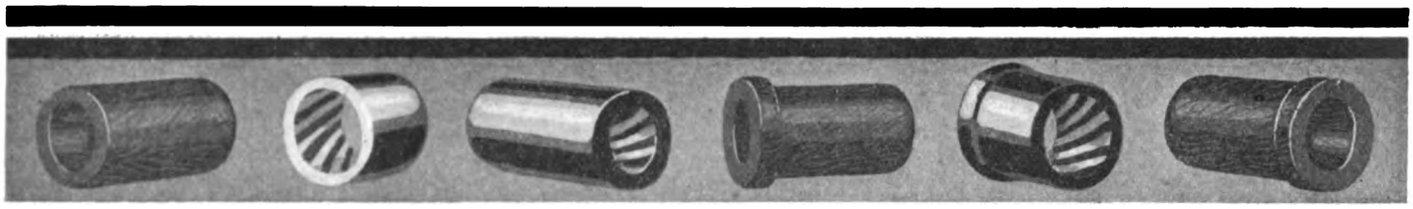
Columbia

Excess Value Without Excessive Cost

The standards we have set for ourselves are your best protection for higher quality
—of engineering—of materials—of workmanship.

The manufacturing methods we have attained—by applying scientific low-cost production—are your best protection against paying any more for the greater quality we give you.

These accomplishments merit the earnest consideration of every manufacturer of motor cars.



We invite the closest and most searching investigation into our methods and product.

If you are looking for higher quality, fair prices and prompt deliveries, write us today.

We are ready to serve you.

Safeguarding the Templar Car

THERE are 26 genuine oil-less bushings in the Templar Car. They are put there to guard it against neglect, to assure it a long life of efficient service in spite of careless and indifferent treatment.

These bushings are in out-of-the-way, liable-to-be-neglected places. They would never be noticed by the average purchaser. But they form an important part of the network of protection that the Templar's manufacturers have built around the reputation of their car.

The thoroughness with which the Templar Engineers have studied the problem of safe-guarding their car is indicated by the number and location of these Oil-less Bushings, as follows:

BOUND BROOK & NIGRUM

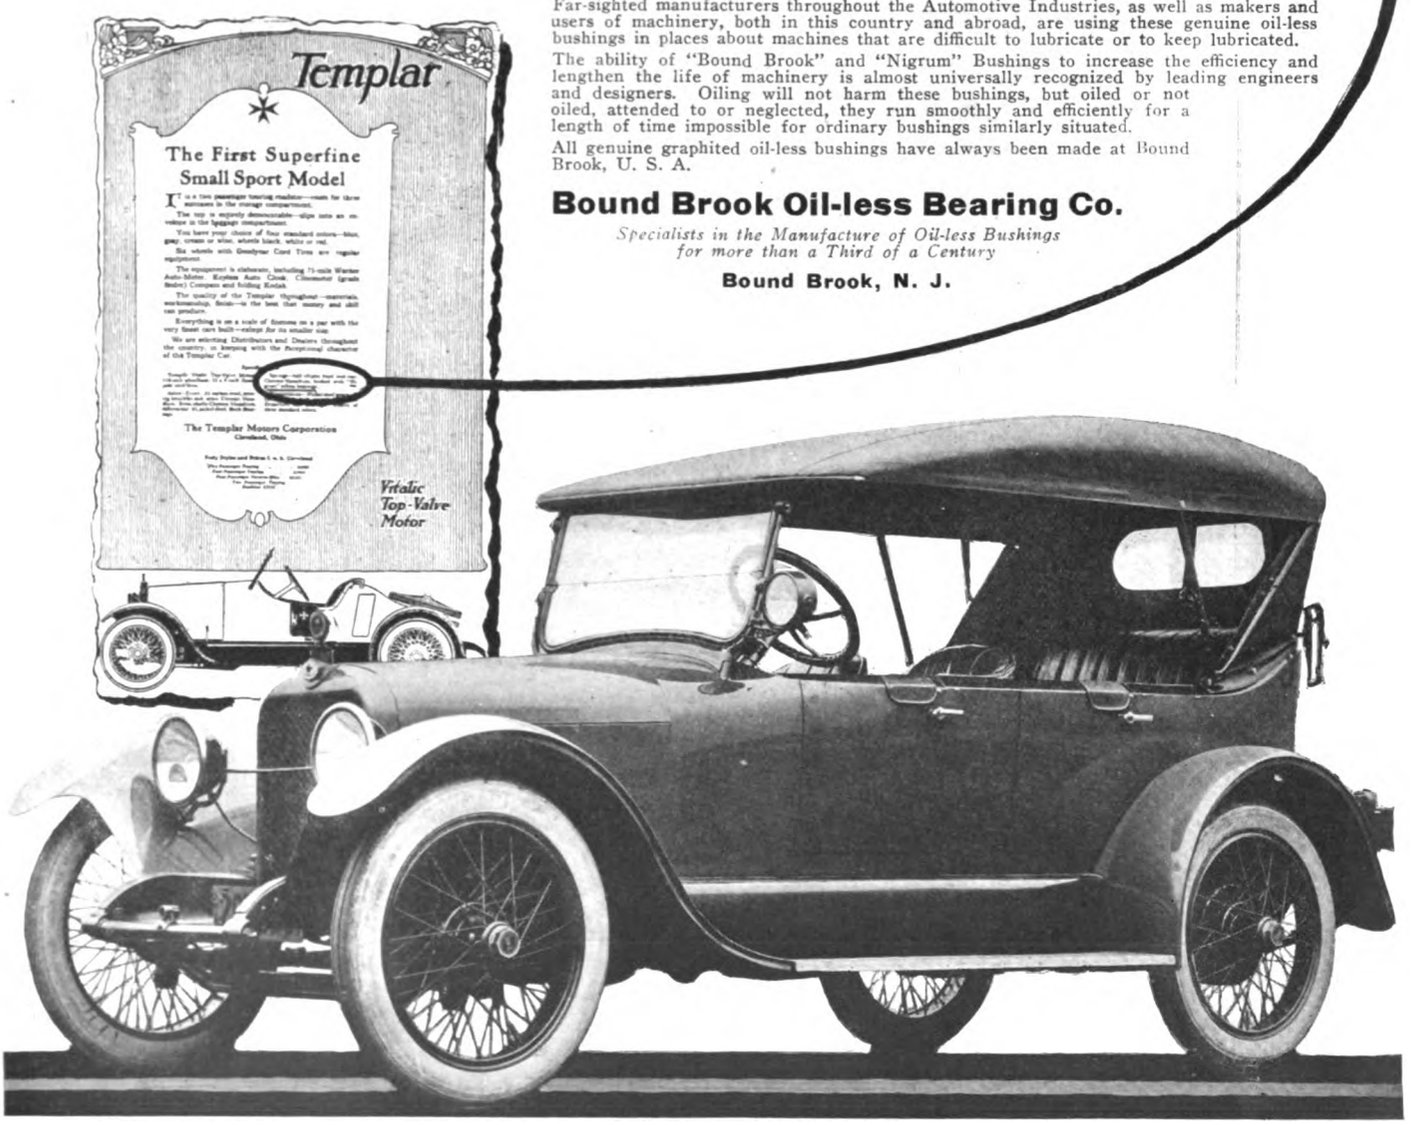
Trade Mark Reg. U. S. Pat. Office — Trade Mark Reg. U. S. Pat. Office

Oil-less Bushings

"BOUND BROOK" (trade mark reg. U. S. Pat. Off.) Graphite-and-Bronze Oil-less Bushings in the Steering Gear, the Water Pump, and in the Transmission as a pilot bushing.

"NIGRUM" (trade mark reg. U. S. Pat. Off.) Impregnated-Wood Oil-less Bushings in the Rear Springs, Front Springs, Brake Cross Shaft, Pedal Shaft, Foot Pedal and Rear Spring Bracket.

Far-sighted manufacturers throughout the Automotive Industries, as well as makers and users of machinery, both in this country and abroad, are using these genuine oil-less bushings in places about machines that are difficult to lubricate or to keep lubricated.



The ability of "Bound Brook" and "Nigrum" Bushings to increase the efficiency and lengthen the life of machinery is almost universally recognized by leading engineers and designers. Oiling will not harm these bushings, but oiled or not oiled, attended to or neglected, they run smoothly and efficiently for a length of time impossible for ordinary bushings similarly situated.

All genuine graphited oil-less bushings have always been made at Bound Brook, U. S. A.

Bound Brook Oil-less Bearing Co.

Strength your Customers can see

The *patented*, forged-steel I-Beam carries *all* the load. The driving parts are confined entirely to *driving*.

The strength and light weight of the I-Beam makes Torbensen Drive long-lasting and economical.

Driving *at* the Wheel and *near* the Rim gives great driving leverage—great pulling power.

Your customer *knows* that an I-Beam is the strongest and lightest load carrier. He knows that in bridges and all structural work I-Beams are employed to carry the load. He knows that all front axles are I-Beams.

He can *see* that the rear load of a Torbensen Drive Truck is carried on a forged-steel I-Beam.

He doesn't have to be an engineer to understand that a Torbensen, because of its I-Beam, is stronger and yet lighter than any other type of truck axle drive.

When you tell him that the Torbensen I-Beam is patented and that no other rear axle drive does or can have this patented I-Beam, you clinch his belief in Torbensen superiority.

Your customer also knows that power applied near the rim of a wheel is more effective than power applied at the hub. He can move a truck by hand when he takes hold at the rim, but he cannot stir it with a wrench on the hub.

So he understands at a glance the advantage of the Torbensen Internal Gear Drive.

Once more, your customer's common sense tells him that driving gears which are subject to road shocks and the full strain of a truck load cannot work as efficiently nor last as long as driving gears which are relieved from all load and road strain. He sees that Torbensen driving gears have nothing to do but *drive*. They work as freely as the gears of a stationary lathe.

It is because the soundness of Torbensen principles is self-evident to the non-technical buyer that more Torbensen Driven Trucks are sold than any other type.

Good Places for BAKELITE

Bakelite has proved an unqualified success in the automobile field because of an unusual combination of qualities possessed by no other material.

Bakelite is ideal for Steering Wheels, Dial Plates, Radiator Caps, Distributors, Commutators, and other parts of Electric Starting, Lighting and Ignition Systems.

BAKELITE

Is not affected by heat.

Is mechanically strong and chemically inert.

Is not affected by water, steam, oils, solvents, or ordinary chemicals.

Automatically assumes a polish in the process of moulding.

Can be economically moulded with metal inserts.

All pieces come from the dies in exact duplicate.

Let us have your specifications and we will tell you just how Bakelite can be utilized to meet your requirements.

The Difference between Magnetos

It lies primarily in the design.

Any Magneto maker can use the best of selected materials if he will. Some do.

But designs are exclusive. They account for the differences both in sturdiness and in electrical efficiency.

For example, the fewer parts in Eisemann Magnetos, and in particular the one-piece frame, contribute enormously to durability and therefore reliability.

Then, too, the direct route by which the current is picked up and distributed prevents electrical losses.

The patented pole pieces and the excellent proportions of the windings are important factors.

To the combination of all these points of superiority may be traced the power of the Eisemann spark.

When thorough investigation and comparison is the basis for selecting the Magneto, Eisemann almost invariably earns the decision.

Insure Loading Efficiency for Users of Your Trucks

Loading motor trucks by man-power alone is costly and slow. In handling heavy materials a small crew is unequal to the strain and a large crew is "in its own way." The net result is inefficiency.

Eliminate all such delays, unnecessary labor and losses of time and money for your patrons by equipping your motor trucks at the factory with the

Otis Power Winch

Thus you will greatly increase the service value and salability of your trucks, and at the same time you will put yourself behind the national campaign for industrial economy.

The Otis Power Winch, compact, simple, strong—backed by the internationally known Otis reputation for quality, enables a small crew to do quickly what a large crew accomplished slowly and laboriously. It makes more trips possible and keeps the trucks operating always at maximum capacity.

We have a convincing booklet on the Otis Power Winch for manufacturers of motor trucks. Let us send it to you.

Asset or Liability?

Gears may be an asset or a liability. The best gears that experience and engineering skill can devise are a distinct asset to any manufacturer in these days of maximum production; uncertain deliveries and delayed transportation make many gears a particular liability at this time.

Speeded up production means that each gear must stand its share of increased strain and wear. Breakdowns and frequent renewals are tremendously expensive.

Protection against such delays and unnecessary expense may be secured at slight additional cost by using gears made from

Carnegie Rolled Steel Blanks

These blanks are forged by hydraulic pressure, then subjected to rolling and forging actions simultaneously, a process which imparts a great uniform strength and toughness to the blanks, which are then ready for machine cutting.

Gears made from Carnegie Rolled Steel Blanks are unusual in strength, and endurance. Severe industrial use has proven that they wear three to seven times as long as a cast steel gear.

To be safe use these gears for protection against breakdowns and frequent renewals.

A BETTER FINISH

FOR THE MANUFACTURER OF ACCESSORIES

The same finish will not answer for all accessories—jacks, mirrors, spotlights, horns, wire wheels, bumpers, moto-meters present different problems in finishing.

The finish must be attractive, protective, lasting. It must help to sell the article, it must protect it from rust, it must *keep* it in good condition as to looks.

For many years we have been studying—and solving—just such problems. Our Hilo "Better-the-Finish" Laboratory has helped many manufacturers to improve the finish of their products, to increase the efficiency of their production methods, and to save time and money.

We should be glad to help you obtain just the finish you want in the manner best suited to your particular requirements. Write for Bulletin No. 1 on Black Japans. It will help you.

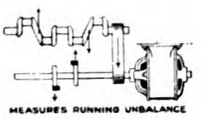
smoother-running engines

Anything that tends to make a smoother-running airplane motor enhances by that much the value of the 'plane as a fighting unit. It means better conditions for pilot and observer, and probably a longer life for the 'plane.

Anything that tends to secure smooth running quickly helps to increase motor production by releasing skilled labor from the task of balancing.

The Carwen method of balancing crankshafts embodies an exact mathematical principle in simple mechanical form. It reduces the time spent in balancing from hours or even days to approximately twenty minutes per crankshaft.



Any good mechanic can learn it in a few hours. The balance secured is close to theoretical perfection, and much better than obtainable by cut-and-try.

MARVELITE
Alight at Night

Marvelite applied to dials of any description makes them easily readable in the dark—the darker it is the better. No lights required.

Marvelited Dials

are the kind to use on autos and aeroplanes and on gauges and other instruments, because—

1st. MARVELITE is made with real radium.
2nd. MARVELITE is the product of the famous Schlesinger Laboratories—one of the largest producers of radium in the world.
3rd. It is permanent for all practical purposes.
4th. It is the luminous compound selected by the United States authorities, meeting the strict Government requirements.
5th. Prominent manufacturers have also selected it from the field because of its demonstrated qualities.
6th. MARVELITE is not dependent upon exposure to artificial light for its luminosity. Such phosphorescent products are short lived and unsatisfactory.

Manufacturers—Send us a dial and hands to be treated, without charge, with MARVELITE. It will prove itself. MARVELITE can be applied by you or by us. Estimates submitted.

Ask for Booklet No. 2—Valuable information about luminous compounds.

TRADE MARK REGISTERED IN
NON-FLUID OIL
UNITED STATES PATENT OFFICE

Costs less per month than common greases. Every particle lubricates better and longer.

No gummy residue to increase friction and waste power. Bearings and gears never wear out.

Recommended by leading auto Mfgrs.

Get "K00 special" grade for gears. "K000" for bearings. At most dealers; in orange colored cans.

Hartford UNIVERSAL Joints

Established 1906
The
Hartford Automobile Parts Co.
Hartford, Conn.
We are able to offer manufacturers universal joints manufactured by specialists in one of the largest plants in the world.
The wearing surfaces of HARTFORD UNIVERSAL JOINTS are hardened and ground, the grinding being accomplished by a specially devised machine whose use eliminates depressions or elevations so common in steel parts that have been simply reamed.
The reputation of your car demands the best universal joints that can be made, and we have them.

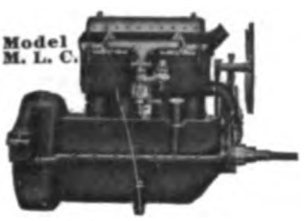
Save the Nation's Gasoline with the

SUNDERMAN $6
Vacuum Carburetor

This price maintains on Ford and Metz models
Other cars $8 and $10, depending on fittings necessary

This perfect carburetor will save you, no matter what your car, from 30 to 50% in your gasoline consumption. At the same time it will give your motor power, speed and flexibility beyond your fondest hopes.



It's your duty to your country to save gasoline when you can. It's a dealer's duty to promote the sale of an instrument that will cheapen the cost of running a car.

Send in your orders now—Fall is a big carburetor season

UNITED STATES DISTRICT COURT. District of New Jersey—In the matter of General Auto Parts Corporation, bankrupt. In bankruptcy. Notice of sale.

Take notice that the undersigned receiver or trustee, to be thereafter appointed, will sell at public auction, provided an order is made, subject to the confirmation of the court, on Thursday, March 14, 1918, at 10.30 o'clock in the forenoon, at room 201, Essex Building, Newark, N. J., certain assets belonging to the above bankrupt corporation, consisting of the following:

Machinery, trade fixtures, office furniture, stock of raw materials, contracts for the manufacture of material and other assets of every kind whatsoever, except the book accounts and bills receivable of the corporation.

The property aforesaid will be offered first as an entity and complete going business. It will then be offered in separate parcels and sold subject to the confirmation of the court in whichever aforesaid manner produces the higher price to the estate. The property may be inspected any day during business hours at 323 Adams Street, Newark, N. J.

The receiver or trustee thereafter to be appointed will present his report of sale to Charles M. Mason, referee in bankruptcy, for confirmation, at the Bankruptcy Court room in the Essex Building, corner of Clinton and Beaver Streets, Newark, N. J., on Thursday, March 14, 1918, at 11.30 o'clock in the forenoon, at which time and place all parties in interest may attend.

"How to Succeed in the Automobile Business," on application—$40,000 equipment—eight instructors—actual work repairing and driving—Day and evening classes. **Greer College of Motoring,** 1456 Wabash Ave., Chicago.

Miscellaneous Storage and Shopping.

The answer to the ever increasing fuel problem brought on us by the enormous number of autos and gas engines is

GAS FROM COAL

I have designed a producer or carburetor that makes dry gas from coal in a simple manner and at 1-7 the cost of gasolene fuel. Will give an interest in this for $1,000 to $2,000 needed to complete its development.

A QUICK TURNOVER—

Manufacturers!

The odd parts and material of all kinds left over from this and maybe previous years' manufacturing can be quickly turned into cash—through the Clearing House Advertising Columns of

AUTOMOTIVE INDUSTRIES

No lot too small or too big to clear up. Send us a list of your odds and ends, and without in any way obligating you we will submit a specimen Clearing House advertisement along with advertising rates.

The SCHATZ "UNIVERSAL"
Annular Ball Bearing — The Super Bearing

Peerless Quality of Materials and Workmanship.

Unapproached Radial and Thrust Efficiency

THREE areas of contact enable the "Universal" to carry with perfect safety 300% to 400% more thrust load than any other known annular ball bearing and to take this amazing thrust load in either direction without adjustment or impairment of annular efficiency.

Inner Race—a third deeper than the average—gives greater strength and safety.

Outer Race—on two integral cups or rings—prevents binding strain under thrust load.

Separator—free from rivets, rivet holes and distance pieces—contains nothing to work loose and injure the bearing.

Internationally Standardized.
Send for catalog.

PIERCE Governors

STANDARD Equipment on SEVENTY-TWO Makes of Trucks

If Pierce Governors did no more than keep motor truck drivers from exceeding the speed limit, they would be worth ten times what they cost.

But that is not the reason why seventy-two truck manufacturers adopted these governors as standard equipment. They don't care a rap how many collisions the driver has, or how many damage suits the owner pays.

Pierce Governors were chosen because they alone positively prevent rapid wear and prohibitive upkeep cost—inevitable results of excessive speeds.

Don't accept a substitute.

The Pierce Governor Company
World's Largest Governor Builders
Anderson, Indiana

AGATHON
Alloy STEELS
IN THE "LAB"

Agathon laboratory tests are exceedingly severe. Chemically and physically, Agathon steels are subjected to every known test to ascertain their fitness for their particular uses—tests which far exceed those of actual service in intensity and severity.

The comprehensiveness of Agathon laboratory tests affords some suggestion of the thoroughness observed through every stage of the production of Agathon Alloys. Agathon methods represent the ultimate in steel making.

Economical in Gasoline

because the Russel Drive is efficient at all speeds—and does not require a large motor to secure maximum power.

Economical on Tires

because the Russel Drive is 50% lighter than other types—due to the fact that it employs no heavy housings for load-carrying duties.

Economical to Lubricate

because the Russel Drive is not sensitive to the lack of lubrication.

Economical on Upkeep

because the Russel Drive can be overhauled by any good mechanic.

"I See"—Said The Truck Buyer

The Truck Buyer looked long and carefully at the "load-carrying axle." He tapped it with his pencil from end to end.

"Carried back of the power-axle—isn't it?" he said.

"Yes," said the Truck Salesman.

"Not connected with the power-axle at all—is it?" he said.

"No," said the Truck Salesman.

"This load-carrying axle is all one piece—of chrome nickel steel—with integral spindles—no 'shoulders'—no weak spots—good idea."

"We believe so," said the Truck Salesman.

"I begin to see," said the Truck Buyer, "why there are no 'broken spindles' in the Russel Internal Gear Drive Axle."

"I thought you'd find it," and the Truck Salesman grinned.

Stop those Leaks

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks instantly without laying up the car. No mechanical experience is required—all you have to do is remove the cap and pour the liquid into the radiator.

JOHNSON'S RADIATOR CEMENT

Johnson's Radiator Cement blends perfectly with the water until it reaches the leaks—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.

Quick—Efficient—Harmless

Johnson's Radiator Cement contains nothing which can coat or clog the cooling system. It will seal leaks in from two to ten minutes.

Quarts, $1.75. Pints, $1.00. Half-pints, 65c.

If your dealer cannot supply you, send us $1.00 and we will forward you a pint, all charges prepaid.

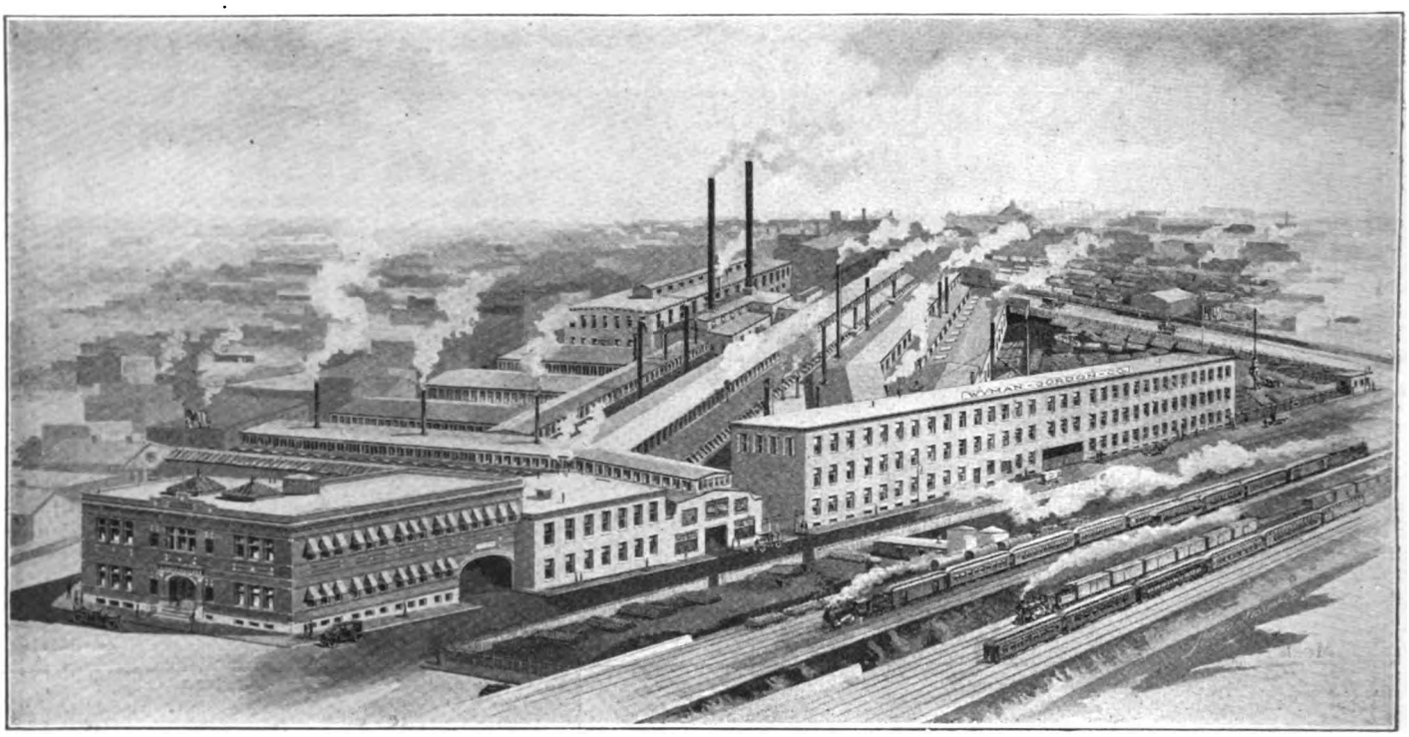
BOWER SAVES POWER

Withstanding the Extra Strain



The front wheel bearings of a pleasure car or motor truck have two distinct thrusts to sustain. First, the downward thrust from the load; second, the side thrust that arises from turns and from the jolts and shocks of rough roads.

Bower Bearings are scientifically designed with a separate surface for each thrust. The downward pressure or "radial thrust" is met by the straight line contact of the roll and raceway, while the flanged head on the roll takes care of the side pressure or "end thrust."

"NORMA"
BALL BEARINGS
(Patented)

The user of a car or truck notes only the bare fact of failure. He concerns himself little with the cause of that failure. He puts the full responsibility up to the builder of the car or truck. His condemnation covers the machine as a whole—no matter how small the part to which the failure is directly chargeable.

Failure of a bearing in magneto or lighting generator means, in effect, failure of the car or truck. Responsible builders, therefore, have protected themselves by adopting magnetos and lighting generators embodying the security against bearing troubles for which "NORMA" stands.

SKF

Parrett Tractor, SKF equipped, in jackshaft and main outboard bearing.

Proof Against Wear and Tear

Ball Bearings marked SKF are self-aligning. That is, they adjust themselves to the agonizing twists, strains and distortions of a farm tractor working over the uneven surfaces of a rolling field.

They do not "stand and take it"; they swiftly, gently, silently adjust themselves to all shaft deflections and load changes, keeping every bit of their efficiency all the time and avoiding the pinching, binding, wearing strain sustained by bearings that are **not** self-aligning.

VOL. XXXVIII NEW YORK—THURSDAY, MARCH 14, 1918—CHICAGO No. 11

Opposition to War Truck Is Acute

Strenuous Objection to It in Spite of Small Numbers Needed As Compared With Great Commercial Demand—War Standardization Needs Different

THE standardized war-truck program which has been under way since last July continues to be the center of attack by a few truck manufacturers, and it is difficult to see why there is such determined opposition to the standardized truck program, when the number of these trucks ordered for army use in France is so small compared to the output of trucks needed for commercial uses at home.

The present order is for 10,000 of these war trucks, which is a relatively small number compared with special types of trucks that have been ordered in much larger numbers for moving artillery where the drive is distributed to the four wheels and where traction is one of the great objects to be obtained. Should this order be raised to 20,000 per year or even higher its proportion then to the total output of the country is so small that it is difficult to understand why the great attack upon it. The truck has been developed to meet peculiar war needs just as special types driving through all four wheels have been purchased in great quantities for use in special war fields. The output of motor trucks for this year for both war and industry will approximate 300,000. It may go higher if materials can be obtained and it is possible to get them delivered to the customer.

It is impossible to compute the total number of trucks needed in the war per million of men. Great Britain and France differ very materially in the numbers needed as compared with each other and as compared with Italy. It is possible that we will require a higher percentage of trucks than either; in fact, the amount of motor apparatus to be used with our army will perhaps be greater than that used by any of the allies; but even then those percentages of standardized vehicles will be very small, perhaps not 10 per cent compared with the consumption of trucks at home.

The present standardized war-truck idea had its conception in the Mexican service two years ago, when truck makers generally agreed that the average commercial truck was not robust enough for such service and a heavier and stronger vehicle was needed. Soon after a committee was formed to work with Washington and it was in this co-operative work that the seeds of the standardized war idea germinated. Later the Washington work passed from one set of hands to another, but the one idea of a standardized war vehicle continued.

When the government last summer issued a call for engineers to assist in the development and design of a standardized truck, including all of the standardized units, there was a very generous response and some of the companies that are to-day opposing the standardized truck movement were co-operators at that time. The majority of them still are.

It is unfortunate that the attack on the war truck should have been delayed until the very month in which production is coming through, as there were ten days ago complete parts for over 200 of the

Digitized by Google

Class B trucks. Much time and energy have been spent on developing these truck parts and manufacturing them, which energy might have been saved if the truck is a failure, as many of those attacking it would like to make out.

Every standardized program that embraces some new scope is sure to be the center of an attack. The standardization program on railroad equipment is now being attacked and yet the railroads are short of equipment and short of men to manufacture it. The standardized boat program was attacked and held up for many valuable months. The standardized aviation engine program has been constantly attacked and has been the goal of some pernicious pro-German propaganda; and the attacks against this engine would have been immeasurably greater if a real aviation industry had existed previous to the time when work was started on the aviation engine. There was very little aviation industry, and while there were a few companies making aviation engines and planes they have very commendably buried existing prejudices and entered into the very imperative air program.

Opposition in France and England Also

In France and England there has been continual opposition to standardized programs. Had several companies been manufacturing tanks previous to the war there is not any question but that there would be on the British front to-day and throughout England a stirring controversy as to which tank should be used and it might be that home politics would declare that two or three different makes be used to the confusion of the army in the field.

Previous to the time the government took hold of the motorcycle situation there was very acute opposition to standardization, although there were relatively few motorcycle manufacturers; yet when the urgent demand for a motorcycle with certain standardized parts was made the job came through. There was not a necessity for a better machine than was being built, but it was essential to have standardized parts in order to eliminate the needless complications of drivers, to reduce the work of part storage and to facilitate repair work. The special war needs had to be met and are being met in the new jobs.

An Example from France

The tank situation in France offers a little example of what a standardized tank means in the matter of repair, because Chinamen are generally used for the repair work on these. These Chinamen are not skilled mechanics. There is a shortage of skilled mechanics in France, but it has been possible to train them into making good repairs when each movement is analyzed and special conveniences devised to effect these several repairs. When trained in this work they do it effectively and speedily. It is questionable if it would be possible to train schools of such mechanics to care for ten or more different models of tanks. The armies in the field would be loaded with a needless burden.

We are to-day not so short of trained mechanics in France that we have to get Chinamen to man our big repair depots, but we are not yet into the war, in a large fighting sense. Recently an army officer of one of our Allies when asked when the war would end, replied: "I do not know when the war will end, but I know when it will begin—the summer of 1919 when the United States gets its fighting machine into work."

We must not forget that the actual fighting of this war is being done in France and Belgium and not at home, and while it is easy to stay at home and run the war and win it, as nine persons out of ten know how to do, it is scarcely fair to our forces on the other side to do a single act that will complicate the job they have on hand. It is scarcely fair to do a single act that will tax more than it is to-day our very acute shipping facilities. It is scarcely fair to do any act that will draw more heavily on our short supply of skilled repair men on the other side. It is scarcely fair to take any step that will require a single additional man in France to do a job, when by some principle of war it could be done with fewer men.

Essential and Non-Essential in War

It is permissible to ask the pertinent question, *Does a time not arrive in any industry which is a prime essential in war, but which has heretofore been only an industry of commerce,* when the war aspect of it must be entirely divorced from the industrial side?

Take an example: Perhaps it is scarcely realized as generally as it should be that the motor truck is a first essential in war. This is the first war the truck has been used in, and when the war started the essential character of the truck in the battle zone was not realized. The war has developed types of motor apparatus that are highly successful in war but at present we cannot see any fields for them in commercial life. We have rifles that are suited for war, there are machine guns for war, but nobody would go shooting in a forest with a military rifle or use a machine gun at a pigeon shoot. This differentiation in firearms has been a program of centuries and as a result the field has very clearly divided itself into two divisions, one of which is war and the other non-war.

Must Not Inject Commercial Aspect

One of the American trucks that is giving a first-class account of itself in France, and has been doing so for nearly three years, is looked upon as quite old-fashioned and almost obsolete at home, and when the contracts for it were first placed there was very general criticism of that particular country for making such a selection. Yet continual reports, and some of them are through official channels, show that it is a favorite, because it is very robust and powerful and gives a good account of itself in the rough work in France and Belgium. This truck is scarcely heard of in commercial circles at home, and its case is an example of how attention must be given to the job of war, and if necessary the products for war must be entirely divorced from those of peace. At least, we must not make our war program suffer because of our desire to inject the commercial aspect too forcibly.

Digitized by Google

It is highly probable that we will yet have to do many things in this war that were not conceived possible only a year ago, and yet we have not had a real battle with the Hun. We must not play this war as if it were to be over in November, as too many think possible. We at home must play the war as it is best played on the slopes of France.

We hold no special brief for the standardized war truck any more than for the standardized tank, the standardized aviation engine, the standardized motorcycle, the standardized machine gun, the standardized rifle and standardized ammunition. The essential reason for all of these standards is best shown in the war zone. There they use standardized houses, standardized hospital depots, standardized ambulance bodies and standardization in everything else that will make it possible to accomplish a greater job in the war zone, in less time and with fewer men than it would otherwise be possible to do it.

May Prove Suitable for Commercial Purposes

The standardized war truck had its inception as a weapon of war on the Mexican plains. It was designed as a weapon of war for the rough work of France. If it might prove suitable for commercial lines that would be a secondary consideration. Because of this it is difficult to construe the present attacks against it, before it has had a fair chance to demonstrate its worth. Some conditions in France are not so bad and some are worse. The ammunition must be moved to the front, and to-day the motor truck is used. Perhaps the truck is not the eventual vehicle for this work. It may soon be done by special types of tanks which will afford much greater protection to the men. That, too, if developed, will unquestionably be a standardized job.

This is no time when financial interests should attempt to serve the purposes of commerce at the expense of our armies in the field. If standardization is good in peace, and we deem it essential in the automobile industry, then it is doubly needed in war.

Standardized Truck Should Have Fair Test

AUTOMOTIVE INDUSTRIES asks for a fair test for the standardized war truck, and not a premature condemnation. Give it as fair a chance as other weapons of the war. The Liberty aviation engine is proving so admirable a job that the use of it in other departments than aviation is at present under investigation, not by us but by our Allies. They have learned the urgent needs of standardization. They have learned the lesson of repair work at the front and training men to make speedy and efficient repairs. They have learned the lesson of the problem of spare parts for multiplicity of machines. Yet the Liberty engine is not through its growing and developing pains, and parts are being changed, and it would be a miracle if there were not parts that had to be changed. Some there are who have continuously condemned it and will continue to condemn it, but the engine goes on and already represents a great war conquest.

It would be surprising if there are not some mechanical defects in the war trucks. There will be some, and there will continue to be some, the same as with all war apparatus. France still has troubles with premature explosions in her guns, but they are not condemned.

Assembling Standardized War Trucks

Class B standardized war trucks in one of the fourteen factories that have contracts to assemble these trucks. Production was to have started in December but it has just started and 300 are to be completed this month

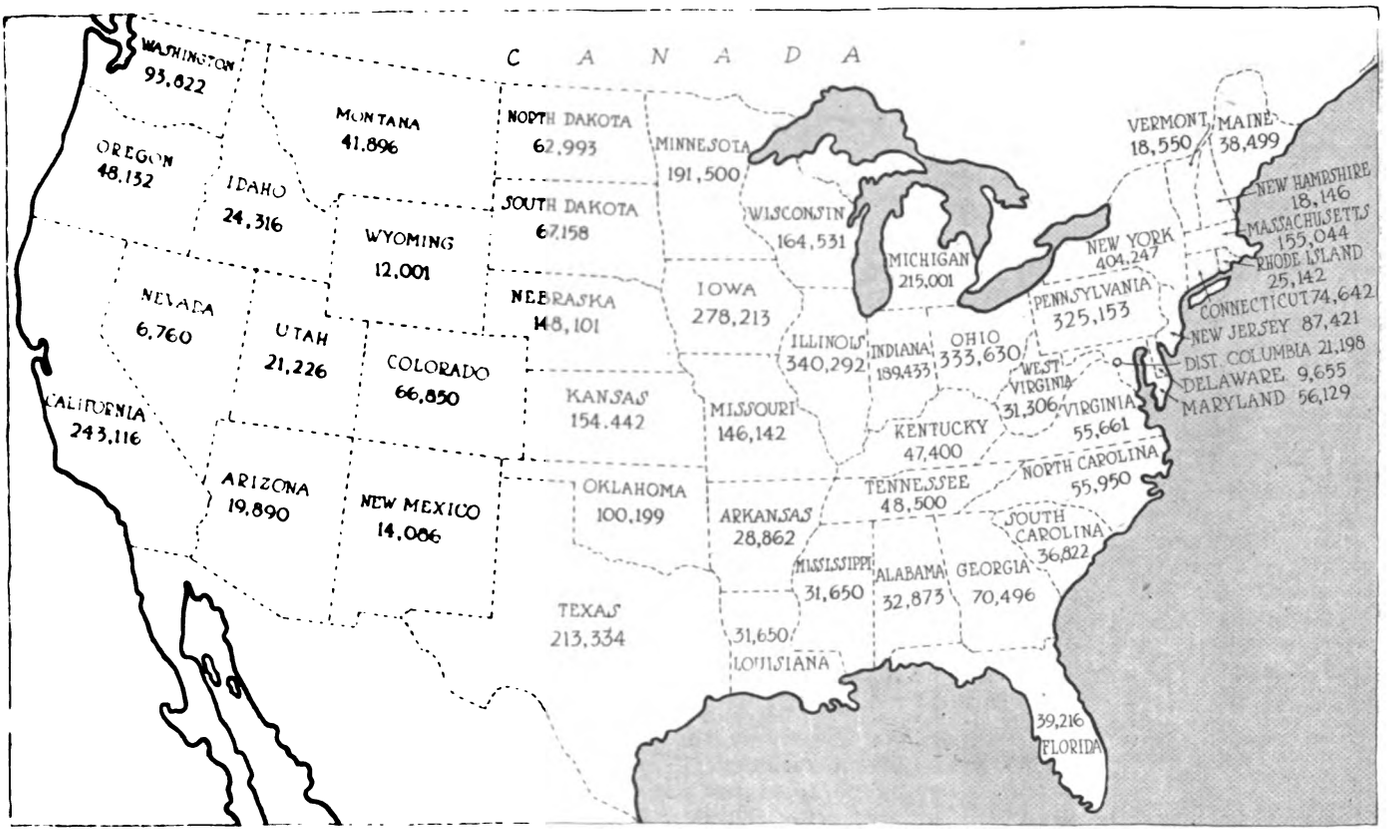
	1,754,570	2,423,788	3,544,952	4,941,276

THE total registration of automobiles and trucks during the calendar year of 1917, the first year of the war, shows an increase over the 1916 registrations, and sets a new record. During 1917 there was a total gain in registration of 1,396,324 automobiles and trucks over 1916. This is greater than the gain of 1916 over 1915, when the increase was over a million. The nine months of war failed to stem the increase in registration, and this stands as an indication of how necessary the automobile is considered even in war days.

The total automobile and truck registration in the country as of Jan. 1, 1918, according to official figures furnished from all of the forty-eight states, is 4,941,276. This figure does not include duplicate registrations, and, of course, does not include hundreds and perhaps some thousands of cars in remote districts, all of which are not registered. In round figures there must have been very close to 5,000,000 automobiles and trucks in the country on the first day of January this year.

One Motor Vehicle for Every 20 Persons



Taking the figures compiled from the registration departments of the states, and placing the population at 103,000,000, there is now one motor vehicle for every twenty persons in the land. A year ago there was one vehicle for every twenty-nine persons. Two years ago there was one vehicle for every forty-two persons.

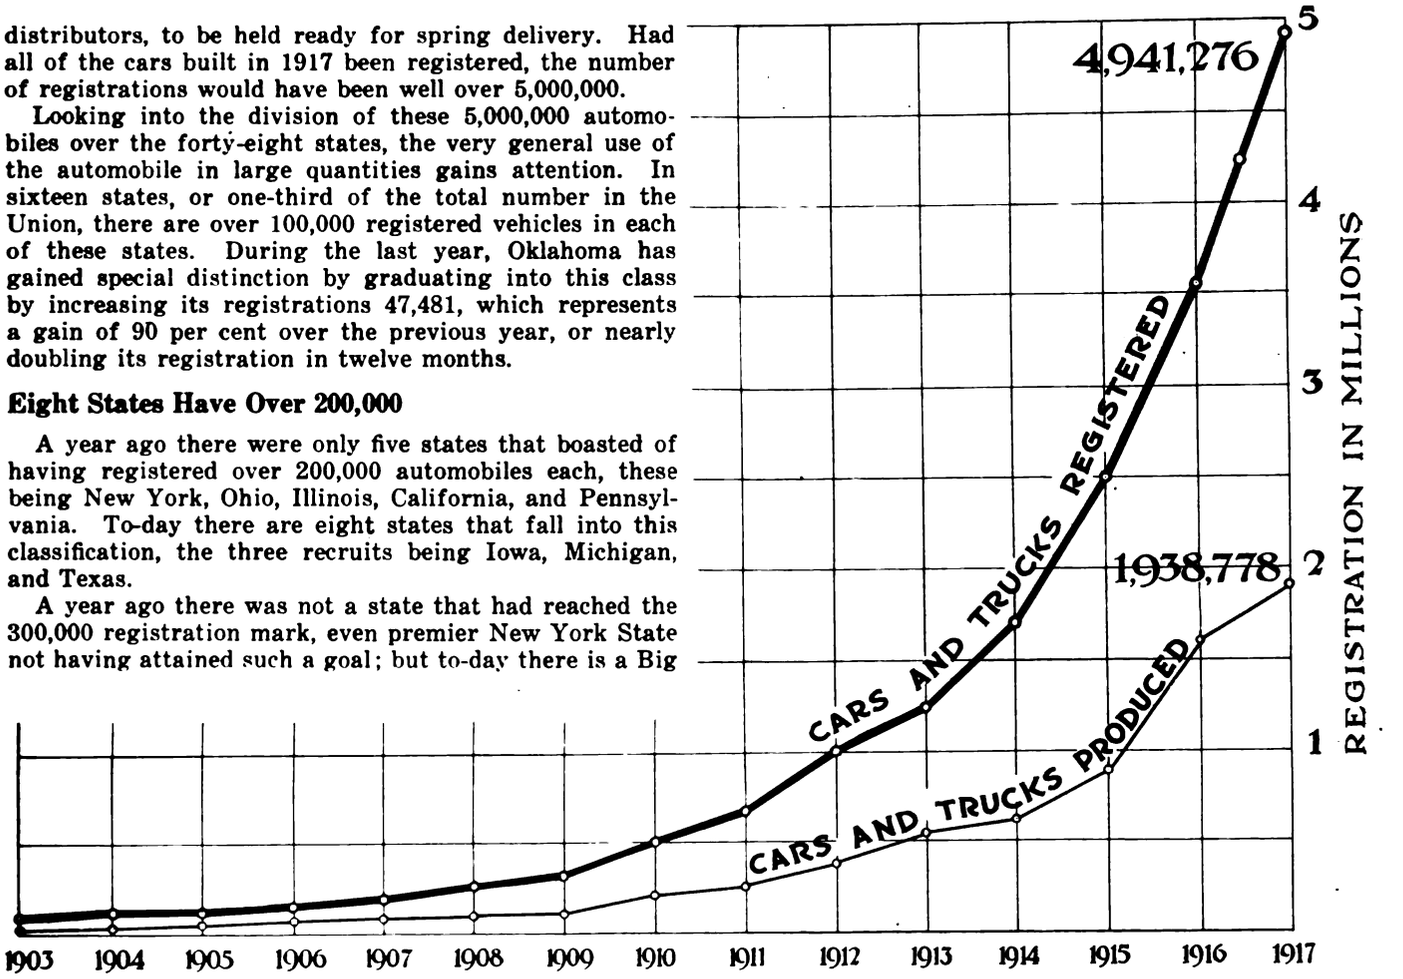
The gains in registrations during the past three calendar years are:

1915 registration gains	686,998
1916 registration gains	1,070,143
1917 registration gains	1,396,324

The total increased registration of 1,396,324 compares favorably with the estimated output of automobiles and trucks during 1917 of 1,938,778, as computed, and generally accepted as being nearly correct. It is natural that a goodly number of cars went out of commission during the year, but not 542,000, as the difference between these figures would indicate. Part of this difference is owing to many automobiles built during the last 3 months of 1917 which were placed in storage by the makers and

Digitized by Google

Registration of passenger and commercial cars in the United States segregated by individual states. Eight states have more than 200,000 vehicles each



distributors, to be held ready for spring delivery. Had all of the cars built in 1917 been registered, the number of registrations would have been well over 5,000,000.

Looking into the division of these 5,000,000 automobiles over the forty-eight states, the very general use of the automobile in large quantities gains attention. In sixteen states, or one-third of the total number in the Union, there are over 100,000 registered vehicles in each of these states. During the last year, Oklahoma has gained special distinction by graduating into this class by increasing its registrations 47,481, which represents a gain of 90 per cent over the previous year, or nearly doubling its registration in twelve months.

Eight States Have Over 200,000

A year ago there were only five states that boasted of having registered over 200,000 automobiles each, these being New York, Ohio, Illinois, California, and Pennsylvania. To-day there are eight states that fall into this classification, the three recruits being Iowa, Michigan, and Texas.

A year ago there was not a state that had reached the 300,000 registration mark, even premier New York State not having attained such a goal; but to-day there is a Big

Since 1903, the curve of registrations of cars and trucks has been a steadily rising one until to-day it nearly touches five million. The production curve has not shown such a consistent rise

Total	103,640,473	4,941,276	21

Four in this 300,000 classification, made up of New York, Illinois, Ohio and Pennsylvania. These four leaders have made large registration gains in the last year, making additions as follows:

New York added.....124,841
Illinois added..... 88,992
Ohio added..... 81,451
Pennsylvania added..... 94,505

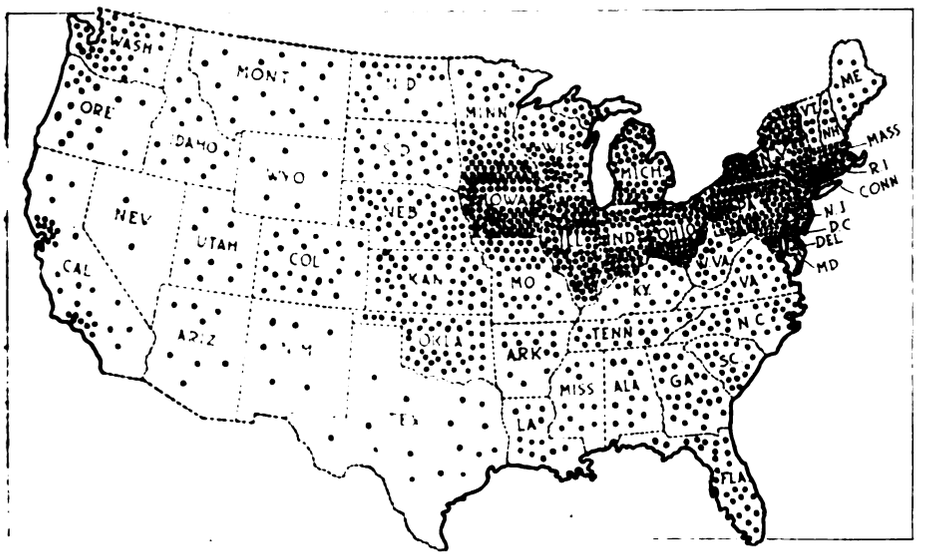
New York State still occupies a premier position, and carries the unique distinction of being the only state to have a registration over 400,000, its official figure as of Jan. 1, 1918, being 404,247.

When an analysis of the forty-eight states with regard to actual gains in registration is made, the leaders are New York, followed by Iowa, the automobile Goliath from west of the Mississippi, which has taken the leadership away from such great central states as Illinois, Ohio, Pennsylvania and Michigan. With the possible exception of Oklahoma, with its record gain during the year the State of Iowa leads in percentage of gains of the fifteen states that have the largest registrations.

Iowa, as a premier agricultural state, gives to the entire world the potent meaning of the necessity of motor apparatus for the great farming areas. There are only five other states in the Union that show a greater percentage gain and these are states of much smaller actual registration.

There is a little coterie of states that have set very high percentages of increase in registration during the year, these including Florida, South Carolina, Arkansas, Idaho, Montana, Arizona, Wyoming, New Mexico and Maryland and the District of Columbia. Florida literally ran away with itself, showing an increase of 176 per cent during the year. Last year there was sold in the state nearly twice as many cars as there were formerly in the state.

South Carolina nearly doubled its car population in the year and so did Arkansas and Oklahoma. Idaho might be classed in this group.



Increase in Registration

State	Increase in Cars	Per Cent Increase

This map will give some idea of where the big increase in registrations has taken place. Each dot represents 1000 vehicles gained during 1917

While phenomenal gains in registrations have been made in these states, all of which except Oklahoma have relatively small registrations, the big substantial gains that make up the 1,396,324 increase in 1917 are found in the great agricultural states, with the possible exception of New York. Here are a few examples of how registrations have gained in the big grain-growing states:

Iowa gained in 1917	105,422
Illinois	88,992
Ohio	81,451
Michigan	55,362
Minnesota	54,000
Indiana	50,295
Oklahoma	47,481
Wisconsin	46,928
Nebraska	46,900
Kansas	40,078
Missouri	38,277
Washington	31,276

Here is a total of nearly 700,000 increased registrations in this dozen of the leading grain-growing states. They head the list of increases in registrations, with two exceptions, New York State and Pennsylvania. They lead California, that was a close runner-up for first honors after New York. They lead Massachusetts, that shows a gain of but 13 per cent in increased registrations during the year, which is the second smallest percentage gain of the year, Texas, with a percentage gain in registrations of 8 per cent, standing at the foot of the ladder of increases. Western Texas suffered very severely from the dry weather, a fact that explains to quite an extent the small gain in 1917.

Taken as a group, the Southern States, by their increased registrations, gave evidence of the flow of

Automobile and Truck Registrations in United States to January 1, 1918

weather due to cotton, sugar and timber. They literally, with the Lone Star State excepted, represent a solid South in big gains, all running over 50 per cent, if we overlook Texas and Alabama, the latter showing 47 per cent only. The roll of honor begins with Florida running wild at 176 per cent gain and followed by the list as follows:

	Per cent gained 1917.	
Florida	176	24,996
South Carolina	89	17,822
Oklahoma	90	47,481
Arkansas	96	14,158

Louisiana	58	11,636
Virginia	57	20,235
Mississippi	54	11,176
Georgia	54	24,721
Tennessee	54	17,100
West Virginia	53	10,869
Kentucky	50	15,900
Alabama	47	10,519
Texas	7	15,647
District of Columbia	61	8,080

This represents a total increase of registration in these Southern States of 296,779, or scarcely one-half the gain in the agricultural states previously analyzed. The phenomenal gains give indication of the still greater ability of these Southern States to absorb automobiles and trucks during 1918. With continued prosperity in the South under the stimulation of war it will not be surprising if 1918 shows a registration increase in these states of 500,000. All during the present winter the South has been asking for cars and there have been factory driveaways on a scale never contemplated before. For the first time the South has given indication of its automobile-buying strength.

Other groups of states to profit under war régime are the mining and oil states. In this group those states such as Oklahoma which possess the profitable combination of oil, and crops as well as live stock give evidence of the increased wealth under war.

In the mining group of Western States, comprising Idaho, Montana, Wyoming, New Mexico, Arizona, Utah, Colorado and Nevada, the gains are very nearly as spectacular as in the solid South. Here the gain percentages run well over 50 with the single exception of Nevada, which, like Alabama in the South, fell below this mark. Idaho gets the leadership, with 87 per cent gain, which is nearly on a par with Oklahoma, which profited so well from oil, agriculture and live stock.

The percentages of gains and the net increases in registrations in this Western group of mining states are:

State.	Per cent gained.	
Idaho	87	11,320
New Mexico	75	6,058
Montana	70	17,311
Wyoming	68	4,876
Arizona	63	3,768
Utah	57	7,719
Colorado	51	22,670
Nevada	47	2,151
Total		79,793

The six New England States as a unit show very low registration gains over the 1916 calendar year, the percentages all running under 50, in fact, the highest percentage is 33, which honor is shared by Connecticut and Maine, whereas the smallest gain, namely 13 per cent, went to the pioneer motoring State of Massachusetts. The New England gains by states in

Statistics by Years

Year	Registration	Production	Value, Output
1911	677,000	210,000	$262,500,000
1912	1,010,483	378,000	378,000,000
1913	1,253,875	483,000	425,000,000
1914	1,736,790	573,114	465,042,474
1915	2,471,595	892,618	691,778,950
1916	3,544,952	1,617,708	1,274,625,864
1917	4,941,276	1,938,778	1,660,134,976

percentages and actual registrations are:

State.	Per cent gained.	
Maine	67	9,548
Connecticut	33	18,594
New Hampshire	26	3,808
Vermont	30	4,299
Rhode Island	17	3,736
Massachusetts	13	18,254
Total		58,239

Compared with the calendar year of 1916, the entire New England territory did not show gains in 1917, as might have been expected. The percentages of registration gains in 1916 were much higher. Maine had 55 per cent, Massachusetts had 53 per cent, as compared with 13 per cent last year. The only New England State that showed a bigger percentage increase in 1917 than in 1916 was Ver-

Guiding the Workman's Personal Expenditures

Ford Reduced Turnover 350 Per Cent by the Simple Psychology of a Peaceful Mind as a Result of Domestic Content

By C. J. Shower

THERE are three ways by which industries can permit employees to share in their profits. The first is to issue stock and allow them to buy it at the inside, rock bottom prices. In this way the employee can share in the prosperity of the company in proportion to the interest given his work. There is no human element connected with it. The employee in this method is, in a sense, an equal to his employer.

The second way is to put money into gymnasiums, libraries, lunch rooms, swimming pools, etc., for the benefit of employees, the employer believing that he can better and more economically spend the money for their welfare than they can themselves.

The third way is to place the money right in the hands of the employee and let him use it as his own judgment dictates. This latter is Henry Ford's view. But there is danger in this method if no guidance accompanies it. Some men cannot use good judgment in the expenditures of money; they are unable to spend it wisely and constructively.

The plan as worked out by Henry Ford has indeed been successful. Statistics show that it has reduced turnover from 370 per cent to only 16 per cent in one year. This is worthy of note, for one of the big problems the employer has is reducing the cost of hiring and training men.

In 1913 the Ford Motor Co. suffered an enormous turnover. There was some reason for that and the company took steps to find the cause. After a long investigation and an analysis of the situation it was found that there were three destroying elements to contend with:

1—The men were working too long hours.

2—Their wages were too small.

3—Housing conditions were unsatisfactory.

Any one reason would tend to make an employee leave and seek work elsewhere. It is obvious that a man would rather work shorter hours for the same pay. He would have more leisure time. If he can obtain more wages elsewhere for the same hours of employment, he will change. And if he is not entirely satisfied with his home surroundings he will move and later he will want to find work nearer his home.

Years ago, when industries were small, there was a close contact between the employer and employee. The employer knew nearly every one of his men more or less intimately and knew his requirements. There was more of a personal element in the connection than now, when industries have grown to large proportions and it is impossible, perhaps futile, for an employer to come in personal contact with such great numbers—30,000 to 50,000 individuals. For this reason it was advisable to organize at the Ford plant a special department whose function it is to keep in personal relation with the employees.

This department is the outcome of the investigation made

several years ago and the results thus far accomplished are praiseworthy. It aims:

1. To improve a man's tastes and at the same time increase his earning power;
2. To teach a man to use his income in a constructive manner;
3. To put a man into a right relation with his family;
4. To put a man into right relations with his community;
5. To put a man right with his work and his employer;
6. To fit the foreigner to become a citizen and to encourage him to do so;
7. To give the man who is down and out a chance to come back.

Shorter Hours—More Pay

The three causes of dissatisfaction on the part of the men, it is believed, have been removed. The working hours have been shortened to 8 hr. a day and the minimum wage was set at $5 a day. Steps have been taken to improve the housing conditions. All three have resulted in very materially reducing the turnover.

An idea of the commendable work done by this department can be gained by reciting a few statistics: In November, 1912, the factory was working on a 9-hr. basis, and was paying about sixty different rates of wages. During that month in order to maintain a working force of 8820 men it was necessary to hire 3732 men, or 42 per cent of the total working force, and during that time 4126 or 46 per cent of the force left its employ. A year later, due to the organization of the Profit-Sharing Plan, it was necessary to hire only 1085 men to maintain a force of 13,500. This shows a percentage of only 8 per cent.

January 12, 1914, the profit-sharing plan was put into effect. Two months later statistics show that the percentage of turnover was decreased still more. The factory had been working on a 9-hr. basis until this time when it adopted an 8-hr. working day. With men being paid higher wages and working shorter hours a marked effect was noted on the production. Almost immediately with these changes an increase was felt.

In the motor department with relatively the same number of men there was an output of 7200 parts in 8 hr. as against that of 6125 in 9 hr.

The radiator department jumped their output from 750 in 9 hr. to 1300 in 8 hr.

In the fender department where 38 fenders were produced in 9 hr. heretofore, the same group of men increased the number to 50 within the 8-hr. day.

Where it took 65 men formerly to produce 800 gasoline tanks in 9 hr., 60 men in the 8 hr. made a total of 1200. Increases were noted in other departments.

In 1913, 52,445 entered the employ of the company and 50,488 left. Note that a number nearly equal to the total force departed. The cost of hiring and fitting each of these men for a job and the expense of firing him have never been definitely determined, but in any event it is exceedingly costly. Some men place the figure as high as $50 per man. This is prohibitive and if any means can be devised to reduce this excessive cost, it is to the advantage of every manufacturer to do so. To-day if the Ford company wishes to increase its working force 100 men only 136 men need be hired, while 5 years ago it was necessary to hire 963 to accomplish the same results. This means that only one-seventh as many men need be hired to get the same increase.

Rules for Profit Sharers

Now in order that a man may enjoy a share in the profits of the Ford company he must comply with certain rules and regulations as laid down by the institution. When this profit-sharing idea was first formulated it was readily seen that it would attract droves of men from other factories and from other cities. To prevent such a catastrophe it was necessary to make a strict rule that no one could secure work at the Ford plant that was at the time employed in another factory. And it was also made clear that no person was to be hired who lived in the city for a period less than three to six months. This first stipulation discouraged an exodus from other plants, while the latter gave little encouragement to the newcomers to the city in search of a soft job. To be entitled to any share of the profits an employee is put on six months' probation. If after that time he has shown that he is using his money in a wise manner and qualifies in other ways, he is at once put on the profit-sharing list. But he must be over 18 years of age before he is put on this list. If he is younger, he is not entitled to any profits unless he has someone solely dependent upon him.

This Welfare Work is done by several departments, each of which takes care of one phase of the work, thus: real estate matters, garnishments, legal matters, etc. But it must not be understood that these divisions are entirely separate; they are all co-ordinated and it is difficult to draw a dividing line.

The work, however, is divided. There are two ends, the outside and the inside:

The outside men, formerly called investigators but now termed advisers, investigate the housing condition of the employee, whether or not he practises thrift, whether he is

The Mechanics of Tractor Spring-Mounting

An Analytical Investigation of Effects Produced When Tractors of Different Types Pass Over Rigid Obstacles

By E. Goldberger

Efficiency Engineer, The Packard Motor Car Co.; formerly Assistant Chief Engineer, The Holt Mfg. Co.

LET us suppose a tractor wheel climbing over an obstacle. If the vertical distance which the wheel is lifted in unit time is large, we say the vertical velocity is large. Vertical velocity = vertical motion in unit time. To impart velocity to a body is to accelerate it. Vertical acceleration = change of vertical component of velocity in unit time. Now, to create such an acceleration requires a force. Experience has taught that the force required to accelerate a body is equal to the product of the mass of the body by the acceleration in unit time.

If the obstacle is hard and strong enough so as not to crumble under the weight of the machine, then it will force the tractor upward, exerting upon the wheel at the point of contact between wheel and obstacle the force required to create that upward motion; hence, if we know the path followed by the wheel we can easily determine the force exerted upon the wheel at any moment.

In Fig. 1 is shown a wheel crossing an obstacle which we will suppose to be perfectly rigid. The shape and size of the obstacle will be considered constant throughout the following investigation, in order to make it easier to compare the effects upon different types of tractor carrying members.

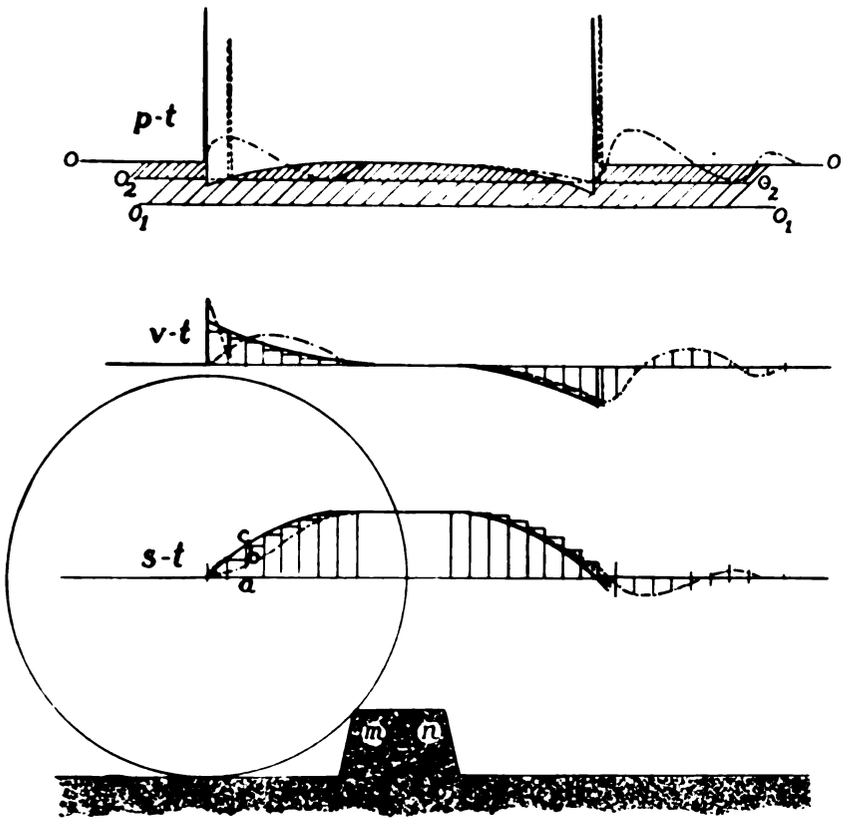
The first curve, marked *s-t*, shows the travel of the point through which pressure due to the weight of the machine is transmitted to the ground, or, vice-versa, the shock from the ground to the machine. If the tractor moves at a uniform speed in a horizontal direction, then the horizontal scale of this curve can be made to represent either the distance or the time of travel, while the vertical scale represents the lift of the center of the forces transmitted to or from the chassis and machinery. The full-drawn *s-t* curve supposes a rigid connection between center of wheel and chassis.

Measuring Vertical Travel

By subdividing the horizontal axis into equal parts, which we may call units of time, and drawing verticals through these points, we can easily scale the vertical travel during every one of these units of time and consider it the average velocity for that small period. Plotting these values in a new curve, we obtain the *v-t* curve, which represents the vertical velocities of the wheel and that part of the tractor which rests on it. The velocities will be positive while the tractor is being raised and negative while it is descending.

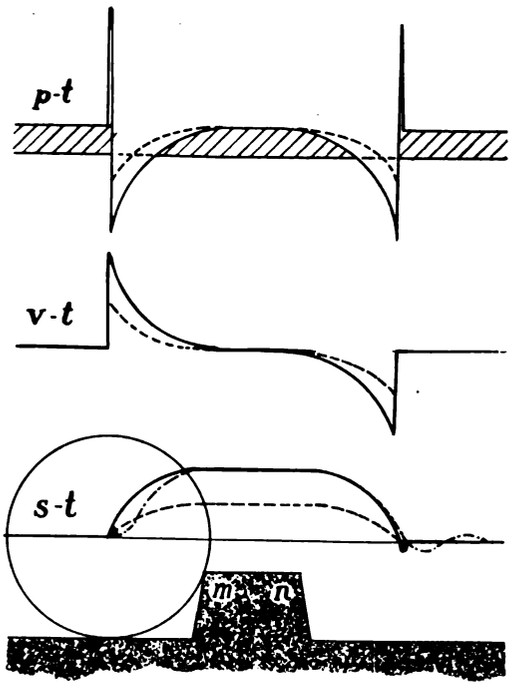
Following the same process, *i.e.*, subdividing the horizontal axis into units of time and scaling the change in vertical velocities, then taking the averages during the small periods and plotting them in the new curve at the top of the graph, we obtain the *p-t* curve, which represents the vertical acceleration of the wheel and chassis.

To find the forces that act upon the wheel, other than that due to the weight it carries, it is only necessary that we read these lengths in the correct units for acceleration and multiply them by the mass of that part of the tractor which rests upon the wheel axle. For our graphic illustration it is advantageous to move the zero line down a distance corresponding to the gravity acceleration, as we can then read both the acceleration force while the tractor is moving over level ground and the increase or decrease of same when it is meeting an obstacle. Since the mass of the body resting on the axle is constant, the *p-t* curve also illustrates the actual forces in play. We note the following:



Impact Force on Rigidly Supported Wheel

If both tractor and ground are supposed to be perfectly rigid, the moment the wheel hits the obstacle, an unlimited upward force acts upon the machine. This force disappears just as quickly as it appeared, and for a moment the tractor loses contact with the ground. The pressure due to weight reappears slowly until the wheel reaches the top of the obstacle. During the descent, the weight disappears slowly again and when the wheel hits the ground it is struck a quick upward blow, the force disappearing again quickly. Not only do these forces attain high values, but they change in value very rapidly, and in consequence they act upon all parts and joints of the machine, not like the pressure of a hydraulic press but like the blows of a hammer. All curves, *i.e.*, those of motion, velocity and acceleration, and, hence, force and impact, are identical whether the wheel is going up or down.



If the traveling speed of the tractor is doubled, the unit of time on the horizontal axis will become a half unit, hence, while the vertical motion is not changed the unit for velocities (used in measuring the *v-t* ordinates) is halved, which means that the vertical velocities are doubled. In the same way we find that the acceleration and the accelerating forces will be quadrupled or increased as the square of the tractor speed.

If the tractor speed is sufficiently high to cause the wheel to lose contact with the ground altogether, due to the blow from the rigid obstacle, then the tractor in coming down to ground again will be dealt another blow, which, however, will not be as severe as the previous one. Not only does the number of the blows increase with increasing speed, but the severity of the impact increases without limit, the dynamic energy being the product of mass by the square of vertical velocity. It is different while the tractor is descending the obstacle. First of all there will be no repeat blows; then, there being no downward force acting on the body, other than gravity, the

Graph 5—Type C Creeper

accumulated dynamic energy cannot increase beyond that represented by the product of weight and height of fall. The dotted lines in Graph 1 represent the *s*, *v* and *p-t* curves while the body is off the ground.

With obstacles that are not rigid conditions are somewhat changed. Before the force reaches its peak, due to the reaction working upon the non-rigid obstacle, it will either crumble down or compress, hence the *s-t* curve will look somewhat like the dot-and-dash curve on the ascending member. The *v-t* and *p-t* curves will also be changed and will have no indicating blows.

We also note that any sudden break in the curvature of the *s-t* curve corresponds to a blow in the *p-t* curve and the greater the change in direction of the *s-t* curve (all other conditions being identical) the harder the blow will be. This we shall use later in comparing different types of wheels with respect to the blows that occur.

Graph 2 represents a wheel of half the size as the one in Graph 1, passing over the same obstacle. It is readily seen that the angle in the *s-t* curve is greater. So are the vertical velocities and accelerations, which are here drawn to the same scale as in Graph 1.

If the two front wheels of a tractor are connected by a front axle which itself is pivoted on the frame, then when one wheel crosses an obstacle the frame resting on the pivot will be raised only half as much as the wheel; with this reduction in the rise, the angle, velocities, impact, etc., are also halved. With one front wheel rigidly connected to the chassis the blows transmitted are twice as large as with two wheels on a pivoted front axle, provided one wheel passes over an obstacle and the other wheel runs on the level ground. Any good tractor driver will prefer to cross ditches at an angle than straight on.

Since the impact increases with the mass of the body, a heavy tractor is at a great disadvantage as far as force of impacts and durability are concerned. However, the most potent means of decreasing impact forces are a decrease in the tractor speed and changes in the *s-t* curve. The first method is not economical in a general purpose tractor, and where we have to run over rough ground spring mounting is the only practical solution.

Impact Force on Spring Mounted Wheel

The dot-and-dash curves in Graph 1 show the effect of spring-mounting tractors. To accelerate the body of the tractor upward requires a very large force, which is transmitted through the connection between wheel and frame, but if a spring is interposed the force of the blow to the wheel will first compress the spring. In the *s-t* curve *a-c* is the distance the wheel center has been raised up to a certain time; *b-c* is the distance the spring has been compressed, so the heavy chassis has been lifted only a distance *a-b*. From the *p-t* curve we can see that the pressures that reach the chassis will be much smaller and change only gradually. No blow comes upon the heavy chassis and the mechanism of the machine either in the ascent or the descent. Further, the ascending and descending, *s*, *v*, and *p-t* curves are no longer identical. Of course, if a certain spring *s-t* curve be chosen there still remains the problem of adapting the spring to the curve.

Impact on Creeper Tractors

After having thus far considered the principles of spring mounting and their application to wheel tractors, in the following these considerations will be applied to three distinct types of creeper tractors. The following will suffice to describe these types:

A_1. Two tracks without front wheel; weight of main frame transmitted to the track sub-frame through the rear axle and in front through a balancing bar pivoted at the middle on the main frame and connected on its ends to the front side of the sub-frames. Intermediate links make up for the unequal travel of the ends of the balancing bar and the sub-frames when crossing obstacles.

A_2. Front balancing bar replaced by leaf spring.

B_1. Two tracks without front wheel; weight of main frame transmitted to sub-frames in the rear through a special, rigidly mounted connecting shaft, and in front the same as on A_1. It is to be noted that there is no connection between the rear axle and sub-frame, and that the track drive sprocket under normal conditions has no contact with the ground, hence does not carry any weight.

B_2. Springs transmit the weight in the rear from main to sub-frame, instead of a rigidly mounted connection; in front there is a solid bar or leaf spring.

C_1. Two tracks and one front wheel. The weight of rigidly mounted connecting shaft placed about in the middle of the sub-frame, and in front to the ground through the front wheel.

C_2. Same as C_1, with the exception that instead of the rigidly mounted connecting shaft, a spring makes a flexible connection between the main frame and the sub-frame.

All the above chassis have three-point suspension. Attention is called to the fact that in the following investigation all three tractors are reduced to the same length, *i.e.*, the center distance from the rear axle to the front supporting member, be it a solid bar, spring or front wheel, is identical on all three types. The main frames with all their parts are supposed to be identical on all types, consequently the center of all external forces acting on the machine was kept in the same point, at one-third the wheel base length ahead of the rear axle. This is not the center of gravity of the machine standing still, but the center of all forces, including that due to weight, draw bar pull (taken at 60 per cent of the actual weight)

Digitized by Google

and its reaction and the adherence of the track to the ground. This is substantially the location of this center on tractors of the described type.

Fig. 3 refers to the Type A creeper. In riding over an obstacle of the shape shown, the front supporting point will describe the curve *F*. Portion *a-b* corresponds to the track rising until the resultant of all external forces through the above-mentioned centers falls in front of the tractor-supporting base on the ground. This point passed, the tractor balances on the obstacle and the front end drops to the ground (portion *b-c* of the curve); riding on the level top of the obstacle gives the curve *c-d;* finally the resultant force advances beyond the front edge of the obstacle, when the track will decline until its front touches the ground (curve *d-e*). During the last period, the rear part of the track, running down on the edge of the obstacle, gives the portion *e-f* of the curve. In the meantime the rear supporting center describes the curve *R*, the small letters corresponding to identical track positions on front and rear curves.

These curves would be correct if the tractor did not progress at all while dropping along *b-c* and *d-e* due to gravity. Actually the curves followed by the supporting points during this period will look somewhat like the heavy dotted line, and the greater the traveling speed the more these portions will be drawn out.

The heavy full line portions of the curves apply, whatever the traveling speed may be, assuming, of course, that the obstacle is rigid enough to resist the pressure without crumbling or changing its shape.

These curves were also drawn for the tractors of the B and C type with exactly the same restrictions in mind as with the A type, while the track starts to climb over the obstacle, the rear connection point *R* rises over above its normal level, while the sub-frame rear end still maintains contact with the ground. If the resultant of the external forces remains in front of point *R*, then the center *S* of the drive sprocket will always float over the ground, but if it falls behind point *R*, the drive shaft will drop until the sprocket supports part of the tractor weight. For tractors B and C the first case holds true. Since the second case, if it occurs on fairly level ground, is really due to a mistake which a good tractor designer should know how to avoid.

Conclusions

Let us now consider the curves and draw conclusions in regard to the impact on the tractor.

The creeper of the A type with rigid connection in passing over the obstacle will be hit once severely in the front joints, while starting the ascent, and once or twice (according to whether the tractor remains on the higher level or drops again to the lower one) during the fall. These last blows will be somewhat lighter, since they will be due to the free fall of the front part of the chassis; counterbalanced by the simultaneous lifting thus reduced, the blow will be lighter. No impact will occur in point *R* during the ascent, and only one during the descent. Since the whole tractor body is now coming down, the blow will be somewhat stronger than in front. By spring mounting the front alone not all the possible shocks are eliminated.

The contour of the tractor is softly outlined for both when in the highest and lowest positions while both tracks cross the obstacle. The dot-and-dash curves are half as high as the full curve, and represent the travel of points *F* and *R* on the axis of the tractor midway between left and right track of the chassis, when one track is crossing the obstacle while the other one is moving on level ground.

In Type B creeper the front connections are the same as those of the A type, and so are the conditions determining the motion. The rear connection, however, presents a new feature. As previously stated, the whole weight of the rear part of the tractor usually is transmitted to the sub-frame and then to the ground through point *R*, and this is the case during the ascent over an obstacle, but when the tractor is descending from the obstacle, the sprocket *S* comes slowly in contact with the ground (through the track directly) and carries part of the tractor weight, thus entirely relieving point *R*. When point *S* reaches its usual level it is floating again, and the blow occurs in the *R* connection, thus relieving the sprocket axle shaft.

By replacing the rigid connection in *R* with a spring connection, and spring-mounting the front rocking member, this tractor can easily be protected against shocks. The extreme tractor portions as well as points *F* and *R* of the tractor chassis when only one of the tracks meets an obstacle are indicated in the same way as for the A type.

Creeper Tractor with Front Wheel

With Type C creeper two blows occur in the front wheel, one during the ascent and the second during the descent. As previously stated, the first impact increases with the square of the speed without limit, while the second blow is limited by the energy represented by the product of mass of the front part of the machine by the height of the obstacle. Connection *R*, if rigid, will go through similar conditions as those described with Type B, except that when the front wheel starts the ascent it lifts point *B*, which is rigidly connected to the main frame, the weight of the rear portion of the frame being transmitted to the ground through the rear axle shaft, and without passing through the sub-frame. This results in a shock. By spring-mounting points *R* and *F* these shocks are prevented.

Besides the shocks that have a direct influence upon the durability of a machine, there is also a surging action —that plunging and heaving while passing over an obstacle which, even though a tractor or a "tank" is not destined for joy riding, it is best to avoid whenever possible.

The extreme positions of the tractor while crossing the obstacle have been outlined for all three creeper types, and it is found that if both tracks cross the obstacle simultaneously, the maximum angles between these positions are as follows:

Type	A	B	C
α	40°	53°	22°

These angles for Type C can be made still smaller by using two front wheels on an axle pivoted at the center, in place of a single front wheel, as considered above. The problem then resolves itself into one of design and not even a difficult one if approached in the right way.

Among American farm tractors of the wheel type only the Wallis is spring-mounted. The Cleveland tractor is a creeper type described above under A, having only the front spring-mounted. A tractor of the B type was built in 1916 by the Holt Company in Peoria, Ill. The rear was spring-mounted, but the front had a rigid connection, though, as shown above, it needs spring-mounting more than the rear. This tractor landed in the "morgue" of the plant after only a few trips.

Type C tractor has a representative in the Holt large size. However, in the Holt caterpillar the center of the external forces comes at what was above proven to be not the most desirable place. Also, instead of having the track sub-frame loaded by the main frame in one point (one spring) it has two rather widely spaced springs, which is of no advantage.

Heated Passage Vs. Hot-Spot System

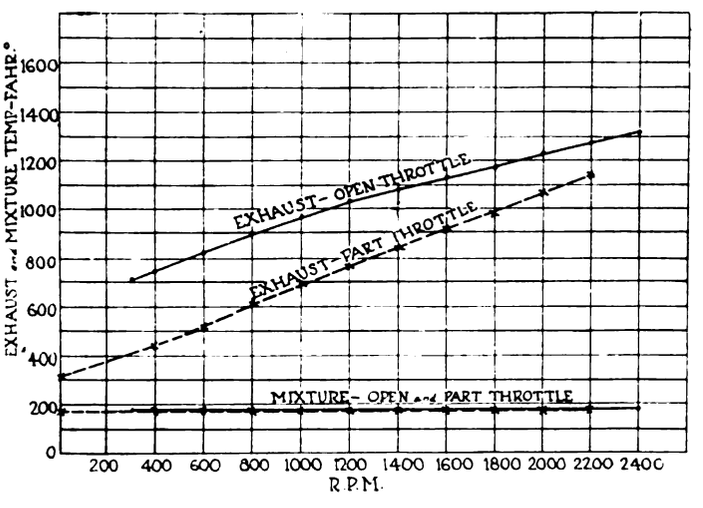
Polymerization a Limiting Factor in Heated-Passage Method—Progressive Evaporation Always the Case

By Percival S. Tice

THE evaporation of fuel in the intake system of an engine must of necessity be a progressive process. The liquid must be brought up to evaporating temperature, and, following this, heat must be made latent in it to bring about its change in state. This is true whether heat is applied at an increasing rate along the length of a passage, for instance, or whether the liquid is brought directly and at once into contact with a source of heat sufficient to evaporate it. Considering that all petroleum fuels are comprised of mixtures of several substances having among them a considerable range of boiling temperatures, from initial to final, the inherently progressive manner of evolution of the vapor is self evident.

Beyond this point the two cases are not directly comparable, since the conditions that must surround each of them, considering that complete evaporation is secured in each case, are widely different.

In the case of the comparatively small bore heated passage of considerable length, the length being necessary to provide a requisite area of heat transmitting surface, it is impossible to maintain the liquid fuel in entrainment in a globular condition. The walls must be wetted in order to utilize the heat transmitting surface which they provide. Here the process is progressive beyond that extent inherently necessary. As the fuel enters this heated passage it exists as a homogeneous mixture of the several substances comprising the fuel. As it passes along it is subjected to distillation and becomes increasingly richer in the higher boiling components as it approaches the discharge end of the passage. If the tube is long enough and provides sufficient surface there will be a point in its length beyond which none of the fuel will exist as liquid. Picture this process going on continuously during operation of the engine, the entrance of the passage containing the whole fuel as liquid, with a progressive diminishment of liquid content and a progressive enrichment of that content in high boiling fractions, along the useful length. Obviously the temperature gradient along the length of the passage will be an inverse of its liquid content. This seems on the surface of things to be an orderly and wholly desirable state of affairs.



Those who have investigated petroleum fuels by fractional distillation know that at the end of the run there always remains a portion of the fuel as residue in the still. Usually we are content to permit the last 5 to 8 per cent so to remain, in order to prevent the fouling of the still by deposition of solid matter which occurs when the sample is evaporated to dryness. Further, and particularly with heavy fuels, as kerosene, the relative amount of residue or of solid matter depends upon the rate and manner of conducting the distillation. Suitable precautions minimize the residue. Also, in the case of kerosene particularly, the unsaturated hydrocarbon content is quite appreciable; and it is well known that among these substances polymerization or formation of resinous condensation products occurs under these conditions. These latter leave a considerable and very obnoxious solid deposit when treated to dryness.

The result of this is that with the heated-passage method of progressive evaporation all this residual matter and whatever polymerization products may have been formed are brought to dryness within a comparatively small portion of the length of the passage. The obvious result is a deposition in the passage of solid matter. This reduces its efficiency as a heat transmitter, and increasingly reduces the capacity of the passage. Naturally, the smaller the passage bore the sooner will it be choked to an extent to interfere with the functioning of the engine.

Choking Depends on Fuel

It has been my experience with several structures embodying the heated-passage method of vaporization that this choking with solid deposits depends largely for its rate upon the fuel that is used, that is, upon the composition of the fuel as determined by its source and method of production, though it proceeds inevitably with all petroleum fuels heavier than gasoline. It is within my experience that 10 days' continuous operation on a certain brand of kerosene caused the practically complete stoppage of a ⅜-in. bore passage.

Naturally, the more nearly constant the conditions surrounding the operation of the engine, particularly with respect to speed and load, the more rapidly will serious deposition occur, since then the process of evaporation is completed more nearly continuously within a smaller portion of the length of the passage. The deposit is thus localized to a greater extent than is the case where much throttle manipulation occurs. Under this latter condition the exhaust temperature varies widely, and consequently so does the length of passage required to complete evaporation. Maintenance of a suitable and adequate heat supply to the exterior walls of the passage, to insure that evaporation be complete under all conditions without undue superheating under certain of them, is one of the really serious problems when it is attempted to supply a flexibly operating engine with fuel vapor from a heated passage or vaporizing tube. Usually it is attempted to be met by use of a thermostatic or manual control of the mass of exhaust permitted to circulate about the vaporizing passage.

Exhaust and mixture temperatures in a 4-cylinder engine operated on kerosene

Turning to a consideration of that method wherein the evaporation is caused to be completed in one spot, as it were, by direct and immediate contact of small masses of liquid with walls sufficiently heated, the conditions are found to be considerably different from the foregoing. First, if the fuel is evenly distributed over the heated surface all portions of that surface perform equally, *i.e.*, there is no tem-

Digitized by Google

perature gradient within the system other than that existing between the heat collecting and heat dissipating surfaces of the walls upon which the liquid is thrown. As must occur, whatever the structural method, the liquid is progressively heated to its several boiling points and absorbs those amounts of heat necessary to the evaporation of its several components. The point of distinction between a successful example of this method and the heated-passage method of the foregoing lies in the fact that in the latter the fuel is distributed over the whole of the available surface in a condition of mechanical division such that each small mass of liquid absorbs the heat necessary for its evaporation from the particular small wall area with which it comes into contact within so small a space of time that it has left that surface before another small mass of liquid appears to make use of that surface. In other words, each unit of surface handles at any one time only its corresponding portion of the total fuel supplied.

Obviously the prime consideration in a utilization of this method lies in the mechanical division or preparation of the liquid before its contact with the vaporizing wall. With this phase suitably carried out, and with the provision of sufficient heated wall area, the vaporizing surface is never wetted in the ordinary sense of the term, and vaporization goes forward at the highest rate possible in view of the nature of the liquid supplied to it. It is none the less progressive, as noted, though it is freed from artificial restraint.

With vaporization being carried to completion over the whole of the surface, in this way, localization of higher boiling components and their residual solid matter is completely avoided. Furthermore, while it is inconceivable that such solid matter is not formed in this method, it is a fact that whatever deposit is formed is being continually subjected to a sort of washing. This may account for the almost infinitesimally thin coating found on the interior walls of such a vaporizing chamber after nearly three years of continuous use. It was found to be impossible to scale off a sample for measurement, the coating being so thin as to resemble a chemically formed black finish.

Passage vs. Spot

To complete this comparison of the two methods, there remains the point of chief distinction between them. In the heated-passage method the vapor and the air used as the vehicle for the liquid fuel are constrained to pass through a highly heated portion of passage under certain much used conditions of operation of an engine. This is inherent in the method, inasmuch as varying lengths of passage are used in the actual evaporation under varying conditions of operation. Obviously the passage must be long enough to complete the process under those operating conditions demanding the greatest length—and thus under conditions where less length would be sufficient more or less superheating of the vapor and air results. Without going into the consequences, at this time, it must be said that this variation is wholly undesirable and is the one thing that is being most striven against in devices intended for the employment of the cheaper and heavier fuels.

With the carbureter and vaporizing chamber arrangement developed by the writer, and with special reference to which the above on direct vaporization method is written, the finely divided fuel is projected in minute globules into a chamber exteriorly heated by the exhaust gases. The arrangement is such that practically none of the air forming the mixture enters this chamber. The result is that the vapor issuing from the vaporizing chamber in a direction contrary to the paths of the ingoing fuel particles is never normally subjected to superheating. This follows from the fact that it at all times exists in the presence of its own liquid, and is thus always at the temperature of saturation, which in this case varies only with the pressure existing in the system. Following its issuance from the chamber in vapor form, the fuel mixes with the air of the mixture. This latter, being taken in at atmospheric temperature, is cooler than the vapor, causes it to condense into a smoke-like fog, giving up its latent heat to the air. Thus the temperature of the air is raised, giving to the resulting mixture a temperature higher than atmospheric by an amount determined by the relative masses of air and vapor and the heat of vaporization made latent in the vapor.

Since superheating of the vapor cannot occur, as noted, the only item that can cause variations in the temperature of the resulting mixture is, with any one fuel, that of variations in the proportions of the mixture. Furthermore, consistent with the state in which the fuel exists in the final mixture, the temperature of that mixture is the minimum possible. A great deal of checking of mixture proportion and mixture temperature against experimentally determined heats of vaporization, for a wide range of fuels, has shown that in every case the difference between the final mixture temperature and that of the atmosphere is exactly that which would result from the application of an amount of heat equal to the heat of vaporization of the fuel in question to the proportional amount of air used.

From both commercial and operative points of view, the inability to superheat the vapor in this method is of extreme value, in that no regulation of any sort need be imposed on the amount of heat made available to the exterior of the vaporizing chamber. All that is necessary in this direction is so to proportion the surface area of the vaporizer to the quantity of fuel and exhaust temperature that the result sought is attained under the least favorable conditions of operation. This being done, the temperature of the mixture is inflexible and is automatically fixed over the whole range of operation by that inherent characteristic of the fuel used, its heat of vaporization. On this point attention is drawn to the accompanying graph of exhaust and mixture temperatures as found in a four-cylinder engine operated on kerosene. The part throttle curves, while obtained on the dynamometer, are plotted through points read with the engine loaded and throttle set to deliver the amount of power required to drive the car from which the engine was taken at corresponding speeds on a level cement road. The powers required thus to drive the car were determined by a series of runs on the road with an accelerometer.

Guiding the Workman's Personal Expenditures

(*Continued from page* 541)

on a solid, wholesome basis of living, whether he needs medical attention, also whether or not he is in debt. This investigation is made within 30 days after the man is hired, after which a recommendation is made to the proper inside department. If he is deeply in debt, an arrangement is made with his creditors whereby they will deal more leniently with the man in question and every effort will be made to have the matter straightened out at an early date.

The power of firing a man is taken entirely away from the foreman. He can, however, discharge him from his department, in which event the employee returns to the employment office, where he is assigned to some other department.

Another phase of the educational work pursued at the Ford plant is the Ford English school which was started in 1914. The first class of 115 members was graduated in 1915. In February, 1916, a class of 519 was graduated, and in October of the same year a third class comprising 230 men was graduated.

Space does not permit going into detail regarding the many phases this work has. The work is devoted to the human side of life and every problem presents its own individual circumstances and must be solved independently. It is that kind of welfare work that is a man-to-man, character-building proposition.

It must not be assumed because it is successful with the Ford company that the same mode of operation should meet with success in other organizations. The success of the plan depends almost entirely on its correct application to the situation in hand. The same plan may not work to advantage in any other institution. The principle, however, is here and other manufacturers can well learn from what has been accomplished by this wonderfully large organization.

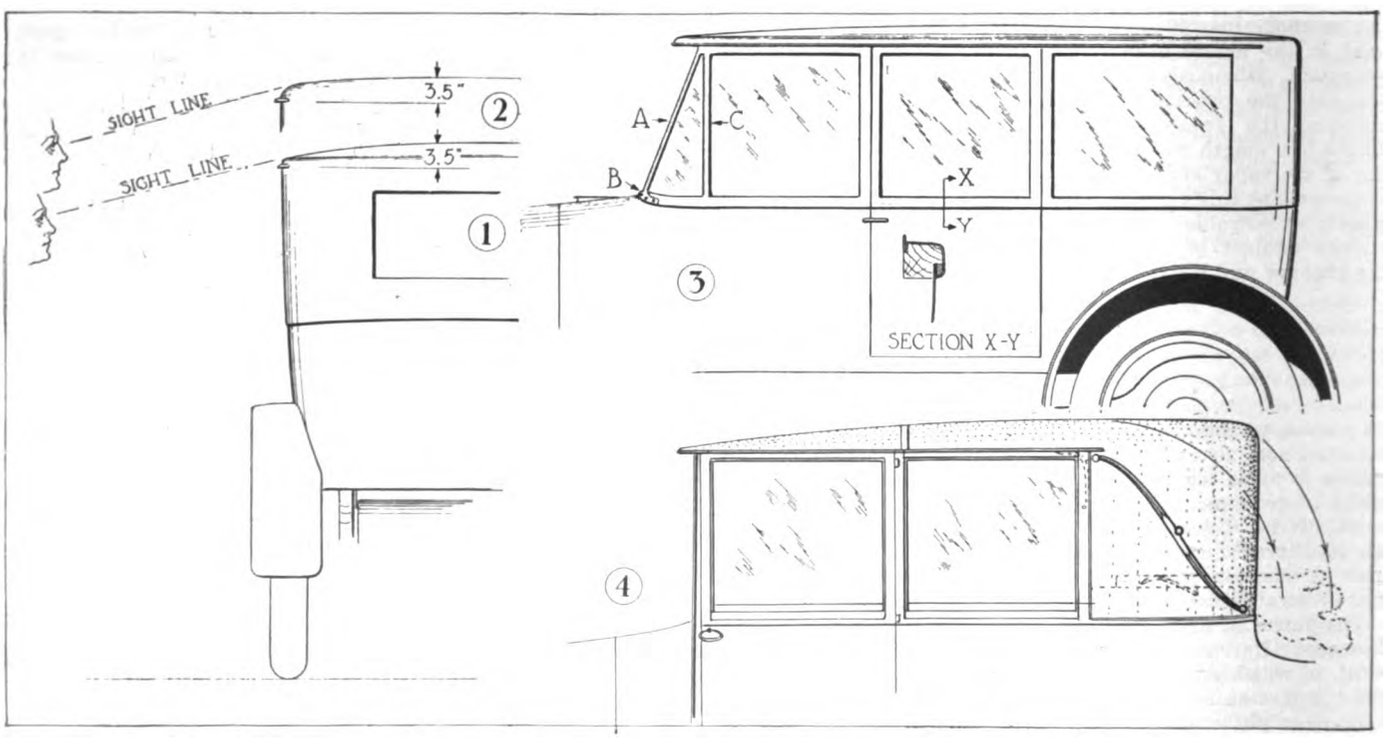
Closed Body Construction

A Pronounced Tendency Toward Lighter Roofs—Three Types of Roof Models Now in Use—Striking New Brewster Design—New Ideas in Windshields and Other Fitments



By George J. Mercer

CLOSED bodies are all made adaptable for use during the changing seasons of the year, and all radical changes in construction in the past few years, or since the flush side body was adopted, have been along the lines of making the conversion features more pronounced. The most conspicuous innovation is embodied in what is called the convertible type, in which the sides are opened from front to rear and the roof remains stationary.

The aim of designers at present is to have the closed body as light looking as possible, and while at the two January shows only the Brewster inside drive body showed originality along these lines, there was a strong undercurrent that will make itself felt in no unmistakable manner once business is back to normal. Very few bodies were exhibited with thick-looking roofs, the majority having roofs of straight lines and medium light looking. Some were very light; there were a few that were heavy, as indicated in Fig. 2, and practically none with the extreme dip at the front and rear. Fig. 3 is a good example of average practice.

Fig. 1 shows how the light appearance is attained with the top. The height of the center above the drip moulding is the same in Figs. 1 and 2, but the thickness of the edge is less in Fig. 1, and this is all that is visible to the eye, as indicated. The thin edge also decreases the framing and actually saves some weight.

The weight of a top like that shown in Fig. 3 is approximately 350 pounds, and this weight set on pillars has a momentum forward when the car is stopped suddenly, and produces a cracking strain at *B*. Therefore, a body with the front pillar at an angle as shown at *A* is better able to withstand the pressure than one with a perpendicular pillar, and manufacturers who produce in quantities make this pillar a casting and bolt through the body framing as shown at *B*, the flange and the bolt heads being visible at the top. A less conspicuous foot is fastened with screws to the top rail. The cast pillar is thinner than one made of wood. All the other pillars are of wood and are cut down in size all that the necessary allowance for runways for glass and the thickness for locks and hinges will permit. This is for the purpose of having the windows as large as possible and to obtain less obstruction to a clear outside view. Also pillar *C* is often eliminated, to improve the design. The only objection to this is that the glass window, being irregular in shape at the front, does not slide so well and is more troublesome to hold tight when down.

Figs. 1 and 2 show how the light appearance is attained. Fig. 3 is a good example of average practice. Fig. 4 illustrates a new falling top body

Digitized by Google

Roofs are of three different types of construction, the carriage roof, the leather covered and the metal. The first two were used on carriages and the last is a development of the automobile metal body.

The carriage roof is a laminated wood panel, ⅜ in. thick, glued over the framing and bows and covered with canvas glued to the panel and painted to make it waterproof. Its disadvantage is that the edges of the canvas tend to come loose from the joint formed by the body metal side panels. To make it serviceable these edges should be secured by mouldings. The leather roof is used largely on high-class work. Its edges are secured by narrow mouldings. The even contour of the roof sweep is obtained by placing a thin wire mesh, fastened to the framing, under the leather and between layers of cotton wadding. This is the lightest roof made, and this and the carriage roof are soundproof. The criticism of the leather roof is that mouldings are required for fastening the leather edges, and these show. The metal roof is of aluminum, in one sheet, welded to the top edges of the back and side body panels. When first used it caused trouble by generating a bell sound inside the body, but this has been overcome by packing well with a deadener of felt and cotton. The metal roof is heavier, but it is also stronger than the others, because the top sheet is continuous with the sides and back, to which it is united by welding, and the solid parts of the rear of the body serve to steady the roof. One other criticism is that the metal roof will not hold the paint as well as the carriage roof under the influence of the sun's rays. Altogether, however, the metal roof is the best manufacturing proposition; the extra weight can be overcome to a large extent by using a lighter wood frame, and there are no mouldings to show. The leather top will be used for special bodies, because leather looks rich, even if a few mouldings are required.

Roof Lighting Methods

The Brewster body at the Astor Salon in New York was a study in methods of making a roof light. The covering was canvas stretched over thin framing and light bows, and the edges were fastened under the drip molding that was continued all around the top edge of the body. This roof was at least 250 pounds lighter than the average body of the same size, which shows what can be done in the way of cutting down weight. This roof will keep out the water as well as the heavier one, and, after all, that is what a roof is for.

The elimination of mouldings on the body is an important matter, the aim being to have the whole exterior unbroken. The section *XY*, Fig. 3, shows the overlap panel by which this is obtained at the belt. This is the place where the upper and lower panels are joined. The illustration shows the upper panel wrapped around a steel band, and when this band is fastened by machine screws the panels are secured in a manner that will never give trouble. Mouldings are also left off doors to a large extent, and, as shown in this same figure, the lower corners are made square, because the panel is also held by a steel band, and the square corner is better for this, because the fitting is easier and the liability of having an irregular opening around the door is less with the square corner than with the round or concave shape.

The convertible, in which the pillars are removed from front to rear, leaving the side entirely open and the roof stationary, is still the most popular of the all-year cars. In most designs the glasses all drop flush, except the rear quarter, which is taken out and put in a pocket at the rear of the back seat, and on the doors flappers are used. The Cadillac design has a much larger glass space than usual, this being made possible by having the glass between the doors and the quarter glass take up part of the pillar thickness, making the latter narrow. These glasses, of course, are too wide to drop and have to be lifted out, but the disadvantage of the extra glass to lift out is compensated for by the increased light space thus provided when the glasses and pillars are in position.

In connection with the front windshield on inside drive bodies, the problem of keeping out the rain has practically been settled by making the lower part of the glass stationary and using a removable rubber channel on the top edge when it rains, the upper part being hinged to swing outward only and coming from ¾ to 1½ in. below the top of the lower part. The sides are protected by rubber in the frame and at the top hinge. The roof projects forward, as in Fig. 3, and, in addition, there is either a metal skirt or moulding nearly covering the joint, or else rubber packing. There were fewer storm visors or double upper glasses, and ventilation at the bottom was by a ventilator in the top of the cowl.

New Falling Top Body

Fig. 4 illustrates a falling top body that is new here and may be described roughly as a combination of the coupelet and the English cabriolet. It is a close coupled four passenger body, and the roof above the door forward is stationary. It is easy to operate and not expensive to build, as no fixtures but those in regular use are required. Folding top bodies showed a slight increase over previous years, but they were nearly all of the cabriolet design. The standard town car cabriolet was exhibited among the stock cars at the Grand Central Palace in New York. The limousine landaulet, so popular a few years ago, has only a few representatives. In connection with the folding top, it is the custom to use the spring at the rear of the back pillar to assist in raising and lowering.

Other general construction features are the almost total absence of cowl lamps. Pillar lamps are confined to the ultra carriage type town car body. Packard uses the flush pillar light. Window regulators are used on the doors and division, but straps are the most common on the rear quarter windows. Extra seats when facing forward are of the floor type and the majority are concealed when not in use, the vertical position when concealed being the most numerous.

The slanting windshield is the most used, and there is a general tendency toward the close-coupled body with the divided front seat, the doors in the middle on both sides, and round corners at rear, the square corner rear being confined to the carriage town car, which generally has the six fenders and steps in place of the runboard.

—

Cork Insert Brake Lining

HAVING heretofore confined itself to the manufacture of brake linings for replacement on Ford cars, the Advance Automobile Accessories Corp., Chicago, Ill., will hereafter also supply these linings for others cars. Cork insert brake lining is made of high grade fabric, into which are inserted disks of cork. The reasons for the use of cork are that it has an exceptionally high friction co-efficient and that this co-efficient is very little affected by the presence of oil on the brake surfaces. Owing to the high friction co-efficient, comparatively little pressure is required on the brake pedal. The lining is impervious to oil and grease, consequently it will not swell and the surface never becomes glazed or slippery.

We are informed that these brake linings have been used by a Chicago taxicab company for over 6 months. It is obvious that the service on a taxicab is very severe, but in spite of this fact, the cork insert lining is said to have given most satisfactory service, the brakes being still as efficient as when installed and show practically no wear.

True Importance of Combustion Chamber Shape Not Known

Opinions Vary as to Its Effect on Economy, Particularly as Regards Ratio of Wall Area to Volume

By J. Edward Schipper

COMBUSTION chamber shape is a matter to which little or no importance is assigned by some engineers, whereas others make it one of the fundamentals of design. With the growing importance of economy, it is important to know definitely whether or not it makes any material difference. Manufacturers of certain types of overhead-valve and overhead-camshaft engines are claiming performances of between 25 to 30 miles to the gallon of gasoline, while others are quite candidly admitting that 12 to 15 miles per gallon is the best that can be secured during the colder months, with only slightly better performance than this during the warm months.

If one type of engine is twice as economical as the other in fuel we should analyze the subject and learn what a factor combustion chamber shape is in this.

The ideal combustion chamber shape, from the theoretical standpoint, is a hemisphere with the base formed by the piston head. Engineers differ as to how important the attainment of this ideal is. It is a practically impossible commercial proposition to attain the spherical shape, but there are makers who endeavor to approach this, and it is important to note whether those who do approach this spherical combustion chamber closest are obtaining, or at least claiming, the highest fuel economy.

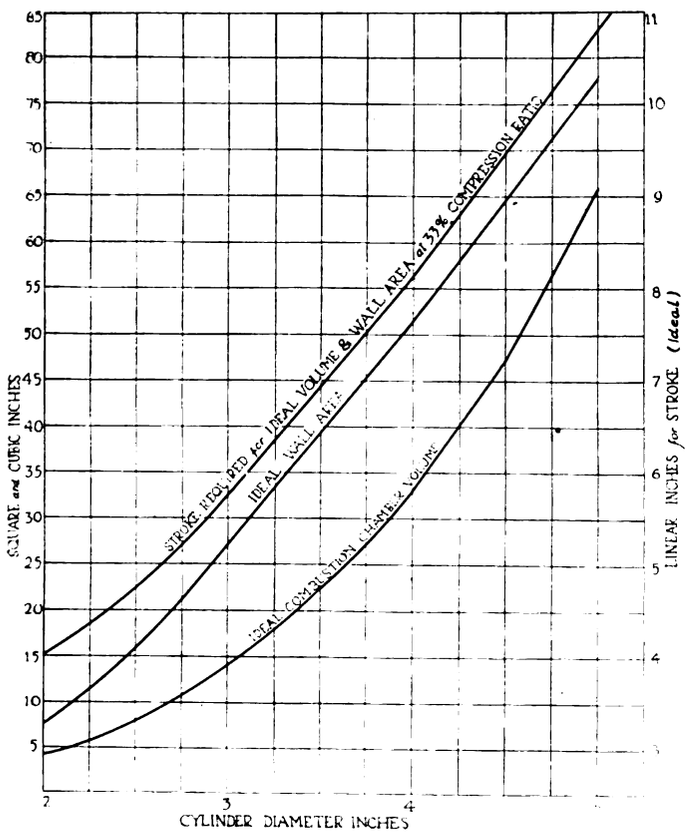

Fig. 1—Curves showing combustion chamber ideal volume (were it possible to secure a perfect hemisphere) for bore diameters from 2 to 5 in. Curves also indicate ideal wall area for hemispherical combustion chamber shapes and the stroke required for ideal volume and wall area at a 33 per cent compression ratio

Big Valves Cause Difficulty

One of the biggest difficulties to overcome in combustion chamber shape is that engineering practice leans toward small bores and large diameter valves. This is true because the valve lift must be taken care of, together with the inertia of the valve gear itself, when the engine is running at very high speeds. This causes the combustion chamber to be higher above the valves than any other place. With these conditions holding true, the shape of the combustion chamber is really controlled in most instances by the exigencies of design, with care taken that both intake and exhaust have a clean sweep so that the gases can flow freely into and out of the cylinder. This creates a condition which is difficult because the smaller the valves the easier it is to secure a good combustion chamber shape, whereas, on the other hand, if the valves are too small there is a reduction in volumetric efficiency, and hence the output for any given cylinder displacement. It seems to be the general consensus of engineering opinion that the shaping of the combustion chamber so that the intake gases act as a cooling agent on the exhaust gases is an erroneous method; in fact, it

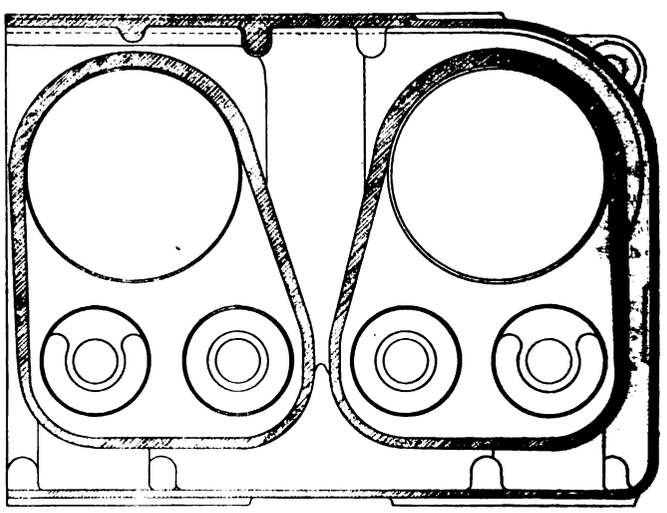

Fig. 2—Horizontal transverse section through combustion chamber of L-head engine, illustrating wide departure from theoretical shape, which would be a hemisphere, and indicating large ratio of superficial wall area to volume

Digitized by Google

is generally believed that the intake gases have very little to do with the cooling of exhaust valves, either on the L, T, or valve-in-head engine. What is of considerable importance is that the superficial wall area does not attain too great a total in comparison with the volume of the combustion chamber.

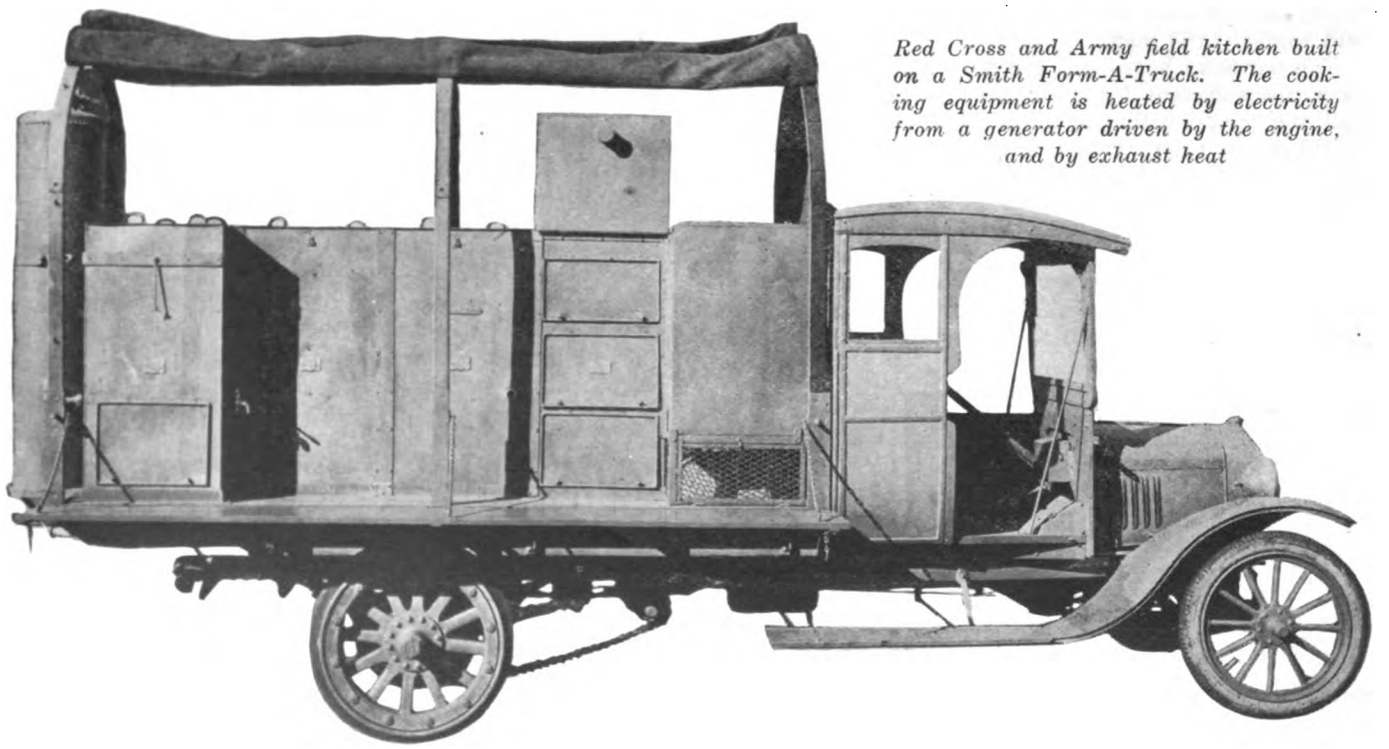
Lose 30 Per Cent by Cooling

The heat passing from the combustion chamber into the cooling jacket is in direct proportion to the area of interior cylinder wall exposed to combustion temperature. When it is rememberd that approximately 30 per cent of the heat of the fuel is dissipated through the cooling water, it is quite important that a careful study be made of the possibilities of reducing this percentage. Since economy has become one of the cardinal virtues of engine design this becomes a matter of prime importance.

Gasoline engines are non-economical when they waste heat; in other words, when all of the heat which could be transformed into useful energy is not taken advantage of because of the thermal inefficiency of the plant. The problem of reducing the amount of heat thrown away through the waterjacket is largely one of combustion chamber shape, and combustion chamber shape is largely a matter of valve location.

A thoroughly impartial study of the subject, both in the laboratory and on the road, would more clearly bring to light the underlying principles of combustion chamber which most closely bear upon this point. The crucial question is: "Can we start with a desirable combustion chamber shape and make the valve layout coincide with this, with the minor modifications necessary for manufacturing reasons; or must we start in the other direction and let the combustion chamber shape follow as it will?" In the true determination of the real effects of combustion chamber shape on performance lies the answer to the question.

As a matter of theoretical interest, there is only a limited range where the volume inclosed by a hemispherical combustion chamber would give practical results. This is true because the stroke required to give a normal compression ratio would either be too small or too large beyond a certain range. This range is indicated graphically in the curve herewith. With a 33-per cent compression ratio, that is, where the compression chamber volume is one-third that of the piston displacement, the stroke required within the range of bore diameters between 2 and 5 in. has a ratio to the bore of about 2 to 1. Beyond bores of 3 in. this is impractical for high-speed work, and in fact is not desirable practice throughout the entire range, as a ratio of 1.5 to 1 is much closer to what has been found desirable.



Smith Form-A-Truck Army Kitchen

ONE of the uses to which motor trucks are put in war time is as portable army kitchens. The cut herewith illustrates such a kitchen built on a Smith Form-A-Truck. It has been worked out to meet every requirement of Red Cross and army field service. Heat for cooking is obtained from an electric heater receiving current from an electric generator driven by the truck engine, and this heater is assisted by heat derived from the exhaust of the engine.

The portable army kitchen is equipped with two 30-gal. fireless cookers, with a 26-hr. cooking heat efficiency, a 30-gal. coffee urn, a 30-gal. vegetable and soup urn, exceptionally well-constructed baking and warming ovens and two large hot-water sterilizing tanks which will sterilize 120 gal. of water in two hours.

In addition to supplying current for the cooking equipment the electric generator has sufficient capacity for operating a 13-in. electric searchlight and 600 electric incandescent lamps working at 110 volts. The searchlight will throw a beam of light for a distance of 3 miles.

The generator being direct connected to the automobile motor, this Red Cross and army kitchen can be operated either while traveling or while standing still.

Red Cross and Army field kitchen built on a Smith Form-A-Truck. The cooking equipment is heated by electricity from a generator driven by the engine, and by exhaust heat

First Standardized Repair Depot For Quartermaster Mechanical Transport

Model for Others Here and in France Will House 2000 Soldiers and 100 Officers—Four Truck Trains Arrive Daily

By Allen Sinsheimer

BALTIMORE, March 9.—The first standardized repair depots for the Quartermaster Mechanical Transport Units at this city and Atlanta, Ga., are well under way. Barracks have been constructed to the number of thirty-two, with a capacity for housing 2000 men at each depot. Ground has been broken for the construction of storage houses, crating shops, and the repairshops. The depots will do truck and passenger-car repair work, assembly work, crating for oversea shipment, and will store parts and complete vehicles and will act as commissaries for automotive supplies for their respective districts.

The depot here will supply eight cantonments and the entire district from Roanoke, Va., to Camp Nevins, Mass., including cantonments as far west as Camp Custer, Mich., and Camp Sherman, Ohio.

This repair depot is built just as the others in this country and in France will be built, with standardization of buildings, shops, tool rooms, etc., so that a mechanic taken from Baltimore and placed at Atlanta, Ga., or at a depot in France, will know immediately where to look for his tools, his barracks, the officers, storage buildings, etc.

Capacity to Be Enlarged

The Baltimore depot, when complete, will have a capacity for 2000 soldiers and 100 officers, although at this time tentative plans are under consideration for an increase in additional building construction and acreage to provide for 3500 soldiers. The main repair shops here will employ 1163 men.

The barracks have been erected in rows of four, with each row sufficient for a company, and a separate mess hall and lavatory for each row, thus providing separate facilities for each company. The repairshops will probably be completed within 90 days.

Equipment has been ordered to be delivered on schedule, and will be ready for installation as soon as the buildings are finished. The site occupies 90 acres, but Col. Leisering, who is in charge of the depot, hopes to secure the purchase of a near-by distillery plant which has an additional 20 acres, and which he intends to convert into storage space.

More Than 60 Buildings

The building plans include four officers' quarters, thirty-two barracks, each 32 x 60 ft., eight mess halls, eight lavatories, one administration building, one post exchange, one medical building, one oven bake room, several minor buildings, one mechanical repairshop, 480 x 497 ft., one storage plant 720 x 136 ft., and another storage plant 554 x 140 ft.

Trucks are being shipped daily to the depot. An average of four trains per day of trucks, with each train carrying thirty trucks, are being received, two of the trains coming daily from Detroit and two from Rochester, N. Y. The Detroit trains, in addition to carrying the trucks, bring with each thirty trucks one roadster, one touring car, one tank car, and one light repair car. Each truck shipped is loaded with 2 to 3 tons of extra parts. There are at present about 700 trucks on hand. It is expected that, making allowance for the requisitions coming in daily for trucks, there will probably be 1200 on hand early next week.

Strategic Location Chosen

The location of the depot at Baltimore is particularly good. It is so situated that it is accessible directly by water and by the Baltimore & Ohio Railroad, which is building five switches through the grounds. It is within a few miles of the freight depots of the Western Maryland and Penn railroads. The trucks can be delivered overland. It is located on the Philadelphia highway, between Baltimore and Philadelphia, easily reached from the Lincoln highway, and therefore convenient for overland driveaways.

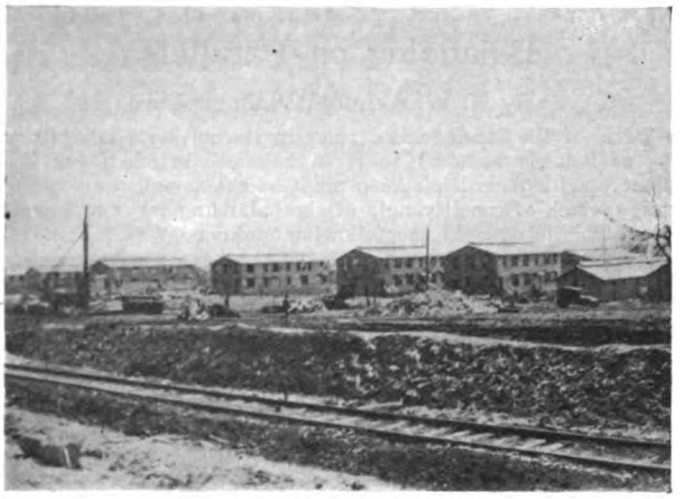
Every attention is being given to the comfort and health of the soldiers who will be stationed at these depots. A near-by river will supply fishing and swimming facilities. An extra plot of land has been set aside for a recreation hall, Y. M. C. A. branch, and Knights of Columbus building. Drinking water will be secured from artesian wells. Separate plots of ground have been set aside to be converted into small parks and baseball grounds.

Colonel Leisering has suggested that a truck company be established at this camp also for the purpose of making truck driveaways from the depot to the points of embarkation.

All Repair Work Standardized

The plan of repair work was outlined in these columns several weeks ago. It comprises a method which includes a shop manual arranged under the direction of George Randles of the Motor Transport Section of the Quartermaster Corps. The shop manual so strictly defines the necessary repairs and procedure that it practically eliminates all opportunity for careless repair work.

For example, the arrangement of all buildings will be the same, having all parts, tools, etc., in the same place in each. This will facilitate the transfer of workmen. The shop manual has been prepared after intensive study of the best methods of making every adjustment and repair that will ever be necessary.



Workmen are not permitted to deviate from the instructions laid down in the manual. Thus, if a cylinder appears in need of regrinding, not even the foreman has authority to say whether it shall be done or not. The repair manual exactly defines when the work is necessary and tells how to do the job.

All tools are standardized, even those in individual kits, and such machines as lathes, shapers, drills, grinders, etc., also are of identical pattern.

Balancing on Parallels

By N. W. Akimoff, Philadelphia

ONE of the fundamental rules in the author's laboratory of balance is never to let a balanced article leave the place until a record has been made of the so-called *sluggishness* or lack of sensitiveness of the balancing ways or parallels. This is done in the following manner:

As soon as perfect static balance has been secured on the balancing machine, in rotation, the article is placed on the ways and a slight static unbalance purposely introduced, to the extent of being felt by the ways. Several positions are being tried and the average entered on records as *sluggishness* or *residual unbalance.*

While the rotary balancing machine leaves absolutely no room for any *personal equation,* as to whether static balance is fair, good or bad, the parallels necessarily must depend on the operator's temperament and other influences, entirely foreign to the problem itself of finding balance.

Such personal element accounts in marked degree for some of the apparent inconsistencies in the submitted table, which nevertheless establishes the fact that very considerable static unbalance can remain in a body, even if carefully balanced on the parallels; this fact is not at all a reflection on the ways, but only tends to establish the limits of their usefulness; those interested in this subject will find some data in the paper recently read by the writer before the A. S. M. E. (December, 1917).

Nature of article	Weight, lbs.	Bearings	Residual static unbalance or sluggishness, in inch-ounces
Crankshaft	68	2⅜"	1.18
"	100	2 7/16"	1.25
"	88	2⅛"	.92
Pulley	112	1⅞"	1.48
Flywheel	126	1⅞"	1.02
"	114	1⅞"	1.97
Crankshaft	63	2⅛"	1.83
"	70	2⅛"	1.56
"	91	2⅝"	1.64
"	30	1¼"	1.95
"	110	2⅛"	.93
"	94	2⅛"	2.12
"	86	2¼"	1.48

Most of the shafts are not over 0.002 in. out; if more, the usefulness of the ways is decreased further.

The permissible amount of residual unbalance of this kind, recommended by the writer is, 4 in.-oz. There is a double reason for bringing down sluggishness: First, static balance as such; and then its importance for securing dynamic balance, the very foundation of which is perfect static balance.

Advantages of Scavenging

By J. B. B.

SCAVENGING is a subject of considerable interest as well as of importance in these times of high-priced gasoline. The latter is frequently of an inferior grade, and the power developed with it is low enough without the fuel charge being diluted with from 25 to 30 per cent of the burnt gases.

Let us take a view of the interior of the combustion chamber when the motor is in action. We see the furnace condition, except when one gives the motor a few whirls with the starter sans spark, and then what a satisfactory decisive pull for a moment or two, until the burnt gas again asserts its influence.

When Otto conceived the idea of an intermediate stroke without firing, his purpose was to reduce the volume of these residual gases, and it was Otto who made the present form of motor good enough to get by with.

But the clearance volume is still full of these detrimental gases and, viewing the interior of the combustion chamber again, we note the new charge coming in and being split up into globules, streaks and eddies with the consequent slow propagation of flame and power. The combustion is also hindered, and none of us know the percentage that goes out through the exhaust without having performed any useful work.

Viewing the interior again, we note how the motor rebels at low speeds, when we are compelled to slow down, and the throttle is admitting just enough fuel to keep in action. Imagine the added flexibility if this small charge came in undiluted by the burnt gases. Also imagine how much less fuel would be required to perform the same service, and do the work better in every way.

Drive out this volume of burnt gas completely, which approximates 800 to 900 degrees Fahr., replace with a fresh pure gas at 70 to 80 degrees Fahr. and the heating of the motor will be diminished in a large degree and with a corresponding saving of lubricant, as it is unquestionably these burnt gases that burn the oil from the cylinder walls. The tendency of the scavenging motor to overheat will be considerably lessened even though the explosion temperature is higher.

The unadulterated gas not only adds power by reason of a greater charge entering the cylinders, but the purer, quicker-burning mixture will give a better torque at low speeds and at the same time speed up the motor and keep down the gas velocity, so that we get a range of flexibility and acceleration in a four-cylinder motor approaching a six of the conventional non-scavenging type.

In expelling all the burnt gases, and substituting a complete pure mixture, the compression temperature is lowered and a corresponding increase in compression would be quite safe as far as pre-ignition is concerned. Together with the spontaneous combustion, a steeper expansion curve in the pressure diagram results. Thus lower terminal pressures and temperatures are reached when the exhaust opens; in other words, the gas is used more expansively.

The unadulterated charge will result in a straight power curve up to very high speeds. This feature alone is a factor of inestimable value in aviation.

With an unadulterated charge, the piston displacement can be reduced by the volume of the original combustion space and then more power generated than previously.

The high temperature in the non-scavenging motor subjects the valves and all parts to undue strain, tends to warp them, and to cause scoring and seizing. Remove the evil influence of these burnt gases, substitute a cool, clean charge, and what improved conditions are obtained for continuous and satisfactory operation.

Furthermore, these burnt gases are a considerable factor in the formation of carbon, which is not the least of the evils occasioned by their presence, and this evil would be minimized by the expulsion of the burnt gases.

Development work on the internal combustion engine has made great strides, and engineers have accomplished wonders, not only in the structure itself, but in carburetion and ignition, but, singularly enough, they have lugged along these burnt gases until they have become a veritable Sinbad.

When scavenging comes into general use, the present non-scavenging motor will be regarded in the light of the original two-cycle motor, except that it is a step forward.

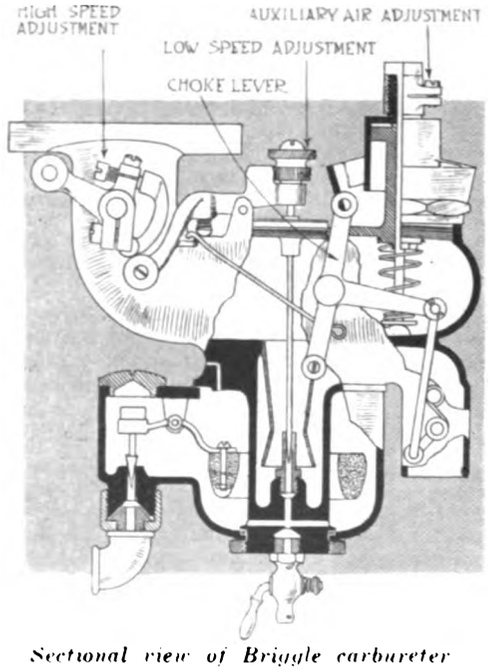
The demand and the necessity for a better and safer aviation motor, however, make scavenging imperative, and this improvement must, and will surely be the next stride forward in the march of internal combustion engine progress.

That the remnant gases cause a loss in efficiency is proved by the superior average performance of large stationary scavenging engines, in which these residues are largely driven

Digitized by Google

out. The need now is for a mechanism to accomplish this much-to-be-desired purpose, that is simple, and will consume as little or even less power to operate than the present non-scavenging type.

We have not worked in this direction sufficiently. The demand for motors for automobiles has grown so quickly that the motor people have fitted themselves with patterns, forms, templets, jigs and tools for types that have been so much better than the original form that they have been reluctant to go into research work. But thanks to aviation, the time has now arrived when improvement must come, and it must be first on the lines of scavenging the burnt gases.



—

Van Briggle Carbureter Has Three Adjustments

ONLY well tried principles are embodied in the Van Briggle carbureter manufactured by the Van Briggle Motor Device Co., 429 North Capital Avenue, Indianapolis, Ind. The device is of the type in which the float chamber is concentric with the mixing chamber. A needle valve is located in the mouth of the spray nozzle and the latter is surrounded by a Venturi tube. The needle valve in the spray nozzle can be adjusted as to height, and is raised more or less according to the position of the throttle valve, which acts upon it through the intermediary of an adjustable cam.

The outstanding feature of the Van Briggle is the thorough provisions made for insuring a rich mixture for starting. Not only are both the air inlets choked off, but the needle valve is lifted out of the spray nozzle so as to render the flow of gasoline as free as possible.

The same as the majority of modern carbureters, the Van Briggle has two air inlets, a primary and a secondary. Both are located on the same side of the carbureter, the primary below and the secondary above. In the primary air inlet there is a choke valve which connects to a three arm lever supported on the carbureter, from which connection can be made to a choking device which is preferably located on the steering post. Air entering the primary air inlet passes down a passage outside the Venturi tube and then up this tube, at the narrowest part of which it has the fuel mixed with it. At its upper end the Venturi tube debouches into a horizontal passage, at one end of which is located the supplementary air valve and at the other the throttle valve. The supplementary valve is of the poppet type and is provided with a dash pot to prevent fluttering. Adjustment of the supplementary air valve can be made by means of a thumb screw on top of the carbureter in a most accessible position, and when the adjustment has been made it can be locked by means of a machine screw. To increase the amount of supplementary air the adjusting nut is turned to the right, while to lessen it, the nut is turned to the left. Pivoted to the hub of the throttle lever is a cam which acts on a lever arm connecting to the gasoline needle valve. The cam can be adjusted by means of a set screw in a lug on the throttle lever hub, and this forms the high speed adjustment. To obtain more gasoline at high speed, the set screw is turned to the right, while to impoverish the mixture at high speed, the screw is turned to the left.

Sectional view of Briggle carbureter

Adjustment for low speed is made by means of a nut at the upper end of the needle valve. To reduce the amount of gasoline at low speed, this nut is turned to the right, while to increase the gasoline, the nut it turned to the left.

As may be seen from the sectional view, the float is of the cork type and acts on a needle valve located in a pocket at the side of the float chamber.

The choking valve, of course, is provided to facilitate starting in cold weather. By means of this device not only can the primary air inlet be entirely shut off, but at the same time the supplementary air valve is held against opening and the needle valve is lifted out of the spray nozzle, so that even though the cranking speed may be low the engine will receive an amount of fuel adequate for starting. When the engine is to be started the choke lever or rod must be pulled up and held tight. After the engine has turned over a few times and picked up its cycle, the choke is released a little, and as the engine warms up, it is completely released. The choke must not be held open too long, as this would result in flooding the carbureter.

The supplementary air valve, of course, is adjusted properly at the factory and the adjustment should not be disturbed unless the engine develops a tendency to "spitting" or backfiring through the carbureter, in which case it is well to adjust the air valve to admit less air.

—

Book Review

AVIATION Engines, Their Design, Construction, Operation, and Repair. By Lieut. Victor W. Pagé, Aviation Section, F. C. U. F. R.; 576 pages and 253 illustrations. Published by the Norman W. Henley Publishing Co., New York. Price, $3.

Owing to the fact that thousands of young men are now being trained in operating and caring for airplanes and airplane engines, there has arisen a demand for a book explaining in simple language the construction and care of such engines. Mr. Pagé, in the book under review, has attempted to meet this demand. The subject-matter is covered in 12 chapters, of which the first two deal with the different classes of aircraft engines and the principles underlying their construction. Separate chapters are devoted to the fuel system, ignition and the lubricating systems. The remaining chapters deal with the practical operation of the engines and their installation on aircraft, while in the final chapter are given brief illustrated descriptions of a considerable number of prominent aircraft engines, both of the stationary and the rotary type. The book should prove useful to flying pupils, aircraft mechanics and others interested in aviation from a practical standpoint.

—

ACCORDING to the *Autocar*, an engine which is inclined to knock on the slightest provocation, can be cured by the use of a fuel composed of a mixture of gasoline and benzol. This is due to the fact that benzol has a higher temperature of ignition than gasoline, and mixing the benzol with the gasoline raises the ignition temperature of the latter.

Traction on Bad Roads or Land*

Second Installment

Four-Wheel Drive, Four-Wheel Steering and Four-Wheel Independent Drive Tractors—Classification of Track-Layer Type Tractors

By L. A. Legros

THE Superquad of the Walter Motor Truck Company, of New York, is an example of four-wheel drive and four-wheel steering. Each axle is fitted with an automatic locking differential of the Walter type, which remains automatically locked for normal running, but becomes unlocked when necessary, for example, in turning the car. The third differential gear on the main shaft, necessary in the case of ordinary differentials, is not required with this device, as either or both wheels on the axle which tends to overrun the other will become unlocked automatically, and will lock again as soon as the distribution of velocity becomes normal.

The vehicle is fitted with a pedal-operated transmission brake and a hand-lever operated back-wheel brake, both of which, owing to the fact that the main differential is either in gear or is locked, also act on all four wheels.

The Jeffery quad is a four-wheel driving and four-wheel steering vehicle. This vehicle is fitted with the M. and S. locking differential on each axle.

Four-wheel Independent Drive with Four-wheel Steering

The Couple-gear electric truck, and also the electric truck, on the same plate, of the Couple-gear Freight Wheel Company, of Grand Rapids, Mich., afford examples of four-wheel independent drive with four-wheel steering.

The wheel is of peculiar construction, having two large-diameter bevel wheels inclosing the motor which is placed out of square with the axle to a sufficient extent to allow both ends of the motor shaft to carry a driving bevel pinion. One of these pinions gears with the outer half of the wheel and the other with the inner half, so that the load on the motor shaft is balanced, a result further insured by the introduction of an "evener" or compensating gear. A channel frame carrying twin solid rubber tires is secured over the two bevel-carrying disks forming the wheel. The gear reduction from motor to wheel is 25 to 1. The motor is carried on a short hollow stub-axle keyed to a taper seat in the steering knuckle and secured by a nut; the wires are led to the motor through the stub-axle pin. The wheels run on roller bearings and are fitted with hand holes with removable doors to give access to the motors. There is one brake of the contracting type to each wheel, and also an electric emergency brake.

To enable the vehicle to be driven over roads which present uneven surface or very unequal resistance to traction a special form of control is arranged. Current is supplied to the motors of the four wheels through a controller of the street-car type modified to suit the conditions. This controller has five contact points, two of which (the third and fifth in the battery car, and the fourth and fifth in the gasoline-electric car) are arranged for what the makers term "parallel speeds," the motors being put in parallel when these contacts are made; thus, if one wheel slips it has no effect on the other three, or if two wheels slip there is no effect on the other two. The other three contacts are for what the makers term "building-up speeds"; on these points a sort of differential action is provided between the two groups of wheels taken diagonally on the car. The right front wheel and left back wheel form one group, and the left front and right back form the other group. When running on the third building-up speed a differential action occurs between the wheels of these groups, so that if one wheel of the group slips, its fellow will be left without power. If under these circumstances the slipping continues, and the driver of the vehicle moves the controller forward to the next contact, all the wheels are then put to work independently of each other.

It is stated that on a dry gravel road a tractive effort equal to 60 per cent of the total weight of the vehicle can be obtained before the wheels begin to slip. This figure depends, of course, on the character of the road surface.

The accumulator-driven type of tractor is only recommended in cases where charging facilities are obtainable and the total daily mileage does not exceed 40 miles. These vehicles are not only used as ordinary lorries, but in many instances are adapted with a pivotal carriage to take the front end of a trailer which may be a goods wagon, fire-escape, or electric-tramway tower wagon. In this application the vehicle is sometimes known as a semi-tractor. The Couple-gear driving system is also applied to two-wheel drive vehicles such as fire engines. Fire escapes are dealt with by two methods, either as a very long wheelbase vehicle or on the semi-tractor principle with a long trailing wagon.

Applications of Four-wheel Drive to Bad Roads or Land

In the mining and agricultural districts of North America vehicles are required to negotiate long stretches of sand or mud. They are required to work on desert land, through sagebrush and among sand dunes, and they may even be used to haul trains of tip-wagons on a light railway straddled by the tractor.

The limitations in all these cases are defined by the engine power, transmission efficiency, insistent load, wheel diameter, tire width, weight of vehicle, and, when a trailer is hauled, the drawbar pull. There is no satisfactory method at present known for estimating the resistance presented by land, sand or mud, so soft that the wheels can sink to a depth of several inches, though it is known that the resistance under such conditions may be as much as 15 per cent to 20 per cent of the load.

Comparative figures for the different types of vehicle, their horsepower, speeds, load, weight, wheelbase, track width, turning radius, and overall dimensions are given in the table.

Conclusions

For the transport of goods over bad roads on gradients, varying from 1 in 15 on roads in which the tires sink 2 in. to 3 in. in depth to 1 in 5 on hard roads with bad surface, and for speeds varying from 1.5 m.p.h. on grades to 12 m.p.h. on fairly level roads, the four-wheel drive tractor has great advantages over the ordinary two-wheel drive tractor.

In the author's opinion it may be expected to rank as an important factor in the development of districts overseas not far removed from railhead, but having only primitive roads.

Chain-Track Tractors

The invention of the endless track or self-laying railway dates to nearly a century and a half ago. The first mention of a scheme analogous to that now adopted in so many forms of tractors is the British invention of Richard Lovell Edgeworth (Feb. 15, 1770) for a "portable railway" or artificial road to move along with any carriage to which it is applied. Although no drawings can be traced of the invention, the

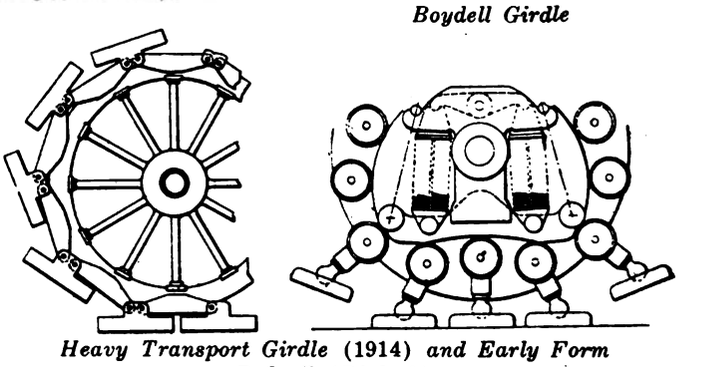
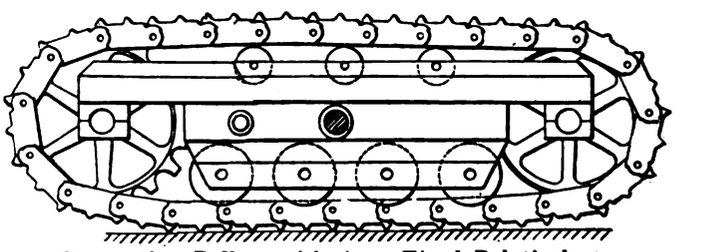
Wheel and Chain-Track Compared



Boydell Girdle

description given is remarkably clear and precise; in fact, almost unaltered, it applies to the greater number of chain-track tractors of to-day.



The Motor Car Acts of 1896 and 1903, while affecting the restrictions on light locomotives, had little, if any, direct influence on the development of chain-track tractors. This type of vehicle owes its development to the very great difficulties presented to wheeled tractors by bad surfaces of road or land.

The necessity for traveling over various kinds of land in moving from place to place has demonstrated the capacity of these vehicles for haulage across alkali and other deserts as well as over clay. To enable chain-track tractors to run on soft or swampy land the insistent weight has been reduced much below that imposed by a horse, which, carried on two feet as in walking, may exert a pressure on the ground of from 20 lb. to 25 lb. per square inch. In fact, many of these machines can be run safely over marsh in which a man would sink to his waist. The pressure exerted by a man when standing on the sole of one boot varies considerably, but may be taken as from 6 lb. to 7 lb. per square inch. Some of the chain-track tractors designed for soft ground have an insistent load of less than 4 lb. per square inch, while in others, specially designed for swampy country and fitted with tracks of abnormal width, this figure falls as low as 1.8 lb. per square inch.

Methods of Kerosene Carburetion

THERE seem to be two schools of thought among the engineers engaged in the development of vaporizing systems for heavy fuels. One school advocates the application of so much heat to the fuel and air passing through the carbureter or vaporizing device that all of the fuel becomes completely vaporized, and to so arrange the inlet passages that there is no chance for it to recondense on its way to the cylinders. The other school objects to this method because it involves the use of such high temperatures that the charge entering the cylinders will be unduly expanded and the volumetric efficiency, in consequence, will be very low. For instance, to completely vaporize kerosene at normal atmospheric pressure requires a temperature of over 500 deg. Fahr., and when air is raised from 60 deg. to 500 deg. Fahr. it expands 80 per cent in volume. This alone would bring the volumetric efficiency down to 55 per cent, and the wire drawing in the inlet passages would decrease it considerably more. Of course, if the fuel is thus thoroughly vaporized there is no difficulty from unequal distribution of the charge and incomplete combustion. Trouble might be anticipated from preignition, since the mixture, already in the state of a dry gas when entering the cylinders, might be raised to the ignition temperature by the heat of compression. However, with low volumetric efficiency the compression, and hence the heat of compression, is also low, which reduces the danger of preignition.

Those who favor the use of a moderate amount of heat generally mix the fuel in the first place with only a fraction of the air required for its complete combustion. This over-rich mixture is heated to such a temperature as to completely gasify the fuel. Just previous to entering the cylinders the mixture is diluted by means of a stream of cold air, to obtain the proper proportion for complete combustion. Naturally, the admixture of the cold air tends to cause some of the fuel to recondense, but various experiments are resorted to in order to prevent precipitation of the fuel on the walls of the passages and thus prevent unequal distribution. The fuel charge does not enter the cylinder as a saturated gas, but evidently the heat of compression is depended on to revaporize any part of the fuel that may return to the liquid state upon the addition of the cold air.

There is no doubt that in this way a higher volumetric efficiency can be obtained than where the whole of the charge is heated to the temperature above the boiling point of the fuel before entering the cylinders. However, a high volumetric efficiency is not an absolute criterion of the results obtained. If the charge is not in such a state as to permit of its complete combustion the power may be low in spite of large fuel consumption.

It is too early to say which of the two plans of preparing combustible mixtures of heavy liquid fuel is the better one. Each has certain things in its favor and probably it will require extended practical experimentation to determine where the balance of advantages lies.

Canada's Boost of the Tractor

THE great need for farm tractors in the present crisis is aptly illustrated by the action of the Canadian government in removing the import tax from tractors selling at less than $1,400. Canada is a country of great agricultural possibilities, but its development has been retarded during the past few years by the scarcity of farm labor. The use of tractors, capable of plowing perhaps 10 acres per day each, instead of the 2 or 3 acres turned over in a day by a horse plow, permits of greatly increasing the tilled acreage with the available supply of labor. One of the provincial governments of the Dominion began last year to supply tractors to farmers at so much an acre. The inference is that a large number of Canadian farmers have not the necessary capital to purchase tractors. Practically all tractors have to come from the United States, and as a very considerable import tax and war tax have had to be paid on them, the cost of a tractor to a Canadian farmer has been very much more than the cost of the same machine in the United States. The removal

Digitized by Google

of the tax will result in a material reduction of tractor prices in Canada and should induce many farmers to buy who formerly regarded a tractor beyond their means.

Curtailment Effect

FOR the first time since curtailment rumors began to spring up in the industry, manufacturers feel that they are on a sound business basis with the Government. They now know exactly to what extent output is to be reduced, and, happily enough, this reduction is about the same as that which would have come about automatically through the acceptance of government work and lack of shipping facilities.

In other words, had no agreement been reached reducing output 30 per cent, the manufacturers would have had to cut to that extent anyway, but they would have been uncertain regarding further restrictions, and, consequently, would have been in a panicky state of mind, rather than in a condition to survey the future with calm confidence.

It is, of course, certain that with reduced production and with an unabated demand, cars are going to be scarce during the coming summer. This condition will affect the dealer far more than the manufacturer, and dealers will have to turn to other lines to increase their income. Throughout the farming districts dealers already have turned to the handling of tractors. In the metropolitan district there has been increased activity in truck sales, and some far-sighted dealers have either added a truck to their line or abandoned passenger cars altogether to concentrate on the sale of trucks.

The effect of the curtailment agreement has been simply to clear the atmosphere. A reduction in manufacturing schedules had already been made and in a great many instances the reduction was appreciably greater than that required by the agreement.

Airplane Schedule

FROM an annual output of a few hundred units to a monthly output of several thousand is a big jump for any industry. When an industry requiring workmanship of the highest degree experiences such a growth in the course of a few months the event is epoch-making.

It is interesting to note what sources furnished the skilled labor necessary to perform the delicate operations so essential in turning out planes. Nowhere has it been possible to find a body of men better adapted to this sort of work than those engaged in the manufacture of high-class closed bodies. In addition to the thousands of men drawn from this field, many were gathered from the furniture and piano factories, cabinet makers' shops, etc.

America's resources in skilled man-power have never been shown more clearly than in this new work, which is the one branch of government activity fully up to, and in some cases ahead of, schedule. Production of the Liberty engine is going ahead rapidly and is keeping pace with wing and fuselage building. The last month has witnessed a turning point in the manufacture of these fighting machines. It is not permissible to publish figures regarding output, but in one mid-Western city alone there are seven plants turning out great quantities of airplane parts and materials. Of these seven not one was previously engaged in airplane manufacture, and three of the plants were not even in existence, but were put up specially to take care of this work.

The airplane schedule is up to date. The tool-designing period is almost over and production is under way in more places than seemed possible only 6 weeks ago. Liberty engine-equipped planes are already in France, and everything points to an unbroken stream of shipments in ever-increasing numbers from now on, providing the shipbuilding schedule can be adhered to.

Guidance for War Inventors

IT is notorious that inventors as a class are very impractical people and that of all the patents issued by the U. S. Government a very small proportion ever bring enough returns to their inventor to cover the patent office and attorney's fees. There is a certain glamour about the inventor's calling that seems to attract many people who do not possess sufficient mechanical ability and business sense to carry their ventures through successfully.

This lack of the practical spirit among inventors has been very conspicuous, we understand, in the suggestions and inventions submitted to the Naval Consulting Board. It was found that a great many of the suggestions made showed an utter lack of comprehension of the particular problem which it was intended to solve.

The war will offer many opportunities for gifted inventors, as the struggle is chiefly one of the most up-to-date means of transportation and fighting. Although production in the different branches cannot be interfered with, the Government is most anxious to fully consider any promising invention in connection with means for fighting the submarine menace, aircraft and aircraft engines, tanks and similar equipment.

Practically all of these devices are quite new and those who wish to share in their technical development should realize that unless they have had some practical experience in the particular line of work, they must first thoroughly familiarize themselves with the requirements of the problem, the historical development of the device to date and the scientific principles underlying its operation.

In connection with the problems of meeting the submarine peril, the Naval Consulting Board some time ago issued a pamphlet giving in very concise form the various aspects of the subject and outlining various possible solutions. It would not be a bad plan to issue similar pamphlets dealing with aircraft and tank problems in the same way, as it would keep inventors from wasting their energies in attempting the impossible and to guide them into the proper channels for effective work.

Wants Fuller Report on Trade

Export Committee of N. A. C. C. Asks Commerce Bureau for Its Co-operation

NEW YORK, March 8—A good active step by way of a scientific investigation into foreign trade and co-operation with the government in this work was started by the export committee of the National Automobile Chamber of Commerce at its meeting yesterday, when it was decided to ask the Bureau of Foreign and Domestic Commerce to secure fuller reports on trade conditions in foreign countries by American consuls and commercial attachés and published by the Bureau. A questionnaire is to be drawn up indicating the particular subjects on which information is most desired by the automobile industry.

Owing to confusion that exists over the licensing of exports of automobile parts containing certain percentages of metals and other articles on the conserved list, the committee decided to ask the War Trade Board to consider the waiving of restrictions on exports of parts, inasmuch as these contain a very small percentage of copper, brass, tin, etc. The exportation of parts for replacements is not an extension of new trade and it is essential to the maintenance of established trade relations that supplies of parts for repairs and replacements should be on hand wherever American cars are sold. The question of licenses on exports to Canada of both cars and parts is also to be taken up with the authorities in Washington so that the requirements will be more definitely understood.

Proposed Rim Standards

With a view to determining the feasibility of standardizing straight-side tires for export, a questionnaire was drafted by the Export Committee of the N. A. C. C. at a recent meeting, to be sent to the tire companies to ascertain to what extent automobile manufacturers can depend upon their customers in foreign countries obtaining straight-side tires in every place where American cars are used.

With the object of making export trade to foreign countries easier, and reduce sales resistance in Spanish-speaking countries, the chamber was directed to work out the details of a good roads' pamphlet with a view to publishing it in English and Spanish to be distributed in countries where highway improvement is in a backward state.

The chamber has already partly completed a table of equivalents of technical automobile terms in Spanish, French, German and Italian, to be used in the preparation of catalogs, instruction books and other trade literature.

Meetings of the export committee are to be held regularly in future at the time of general meetings of members.

The Board of Directors has authorized delegates to represent the N. A. C. C. at the fifth annual Foreign Trade Convention at Cincinnati, April 18-20, and to deliver an address dealing with ways in which the automobile industry is helping to win the war.

Ford to Build Light Tanks

DETROIT, March 11—The Ford Motor Co. is going to produce light tanks for the government. It is reported that if the first model, drafted less than 4 days ago and well under construction now, is accepted, the manufacture will be pushed with all speed and the first shipment will be ready within 60 days. It is also reported that the Ford "tank" is to be a comparatively light machine, carrying a driver and a machine gun operator, and will be driven by two gasoline engines of standard type. It will have the familiar creeper type of traction, and while not intended for the heavy work that has been done by the immense British and French tanks at the front, it is expected to be an effective fighting machine.

—

Washington Bureau for Milwaukee

MILWAUKEE, March 13—Milwaukee manufacturers, with the co-operation of the Milwaukee County Council of Defense, are raising a fund of $30,000 by popular subscription to finance the establishment and maintenance of a bureau of information at Washington. The main function will be to give Milwaukee manufacturers information enabling them to make bids on various Government contracts which otherwise might not be available. The bureau is planned as a permanent institution.

—

Roads Used by Government Military Highways

WASHINGTON, March 13—A bill before the Senate says all State roads used by the Government should be treated as military highways and the Government should assist in keeping them in repair. The bill was introduced by Senator J. W. Smith, who has investigated the deterioration of the Maryland highway system. The bill states the Government is not to contribute more than two-thirds of the money for repairs, nor more than $1,000 per mile. It has gone to the Senate Committee on Appropriation.

Flint Factories Pool Interests

Scheme Worked Out in Co-operation with Y. M. C. A.—All Plants Represented

DETROIT, March 11—Industrial districts in which there are two or more factories can often successfully pool their welfare interests with an increase in economy and more satisfactory results for the men. This method can be used to best advantage in non-competitive centers, that is, where the factories do not compete either in the local labor market or in the sale of their products.

Such an idea has been worked out in Flint. As will be noted, it has been worked out in co-operation with the local Y. M. C. A. This need not necessarily always be the case, but it has worked out to mutual advantage in this instance. The general secretary can be both secretary of the Y. M. C. A. and of the Industrial Fellowship League, as it is called in Flint. The chart is self-explanatory. The general secretary is the nominal manager of the entire enterprise. He receives his instructions in regard to policy from the industrial committee, which is composed of a board of trustees, comprising one member of the industrial committee and two members of the executive board.

The executive board is composed of one representative from each of the plants in the district, and this executive board co-operates with the industrial secretary, who represents the industrial committee in such work as the educational activities and shop benefits, as well as athletic and social events. The work of the industrial committee is divided into two parts, one being educational and the other recreational. The educational activities comprise the holding of evening classes, shop meetings, technical society meetings and lectures. The recreational activies are of an athletic and social nature, including the arrangement of community games and of city stadium games, supervision of athletic activities and the provision of recreation resorts.

Besides these two main divisions there are independent organizations which comprise various factory committees of a welfare nature, a committee of general supervision for welfare work, a committee of factory stores in which small articles are sold to employees, and a committee which has to do with the handling of a factory newspaper, which acts as an organ to further the work of the Fellowship League.

Automotive Industries

Trucks Get Attention of N. A. C. C.

Organization Decides to Make Commercial Vehicle a Real Factor

NEW YORK, March 8—The motor truck seems to be coming into its own so far as the National Automobile Chamber of Commerce is concerned, after having been held in too much subjection by that organization since its inception. At its meeting held this week the chamber decided to put the motor truck on its feet as a real factor in the organization, and with this object in view two classes of membership, a truck division and a passenger car division, with two second vice-presidents in charge, Windsor T. White in charge of the truck classification and H. H. Rice in charge of passenger cars, were formed.

For several years there has been constant uneasiness among many truck makers due to the feeling that the chamber has not been giving that attention to the truck industry which it merited. Recently there have been truck meetings at which the subject of a national truck organization has been discussed and it is not surprising that a comprehensive truck program has been mapped out.

The motor truck show, which was opposed so consistently by the chamber and the ban put on it in New York and Chicago, has come in for recognition and while no definite announcement has been made, the subject was discussed in a preliminary way. Since the truck show was suppressed in New York and Chicago the truck show idea has been very successfully carried on in Boston, Minneapolis, Kansas City, Brooklyn and other cities.

Frequent regular meetings of representatives of the forty-five commercial vehicle manufacturing companies included in the membership of the National Automobile Chamber of Commerce were agreed upon at a meeting of this division of the chamber following the general meeting of members.

Many motor truck makers have been admitted as new members during the past year and one of the principal objects of the regular sessions is to promote greater personal acquaintance among them and afford opportunities for discussing their particular problems, such as have been enjoyed by most of the passenger car manufacturers in the chamber for many years. The meetings will be held in the afternoon of the same days as the general meetings.

A great deal of the activity of the chamber, and of committees representing it in Washington, centers around motor trucks and it is recognized that this branch of the industry has assumed much greater importance than heretofore and that it is confronted with problems all its own.

A resolution was passed calling upon the chairman to appoint a committee of three to investigate and report upon plans for selling motor trucks on the time-payment basis, the consignment of motor trucks to dealers and the consigning of parts to dealers.

Liberty Seaplane Passes All Tests

WASHINGTON, March 14—The first United States Navy fighting seaplane equipped with a Liberty engine has been tried and accepted, and a large number are now being delivered to the Naval Air Service. These will be used in submarine hunting.

The navy is also using what is called the Bristol model fighting plane, and another 2-seated flying boat. The naval Liberty planes are equipped with two Liberty engines, giving a total of 700 hp. This is greatly in excess of the power of British craft.

It has been announced that the last minor defect in the Liberty engine, which was in the lubrication, has been overcome.

—

More Power for American Tanks

WASHINGTON, March 11—An official report states that American supertanks now under construction are greater in power and destructive force than any British or French tanks. They will withstand the fire of small German artillery which damage the French and English tanks.

While gross tonnage of the big tanks being made here exceeds that of the English by only 2.8 per cent, ours have engines three times as powerful, and in addition to its crew can carry a force of 20 men to do trench work. It is said that the super-tanks can span 10-foot trenches. Armament will consist of small cannon and machine guns. A conning tower will permit the latter to shoot in any direction. Owing to the great weight the tanks will travel a maximum speed of 5 miles per hour.

—

100,000 Men for Ford Tractor Work

DETROIT, March 13—Henry Ford will eventually employ 100,000 men in the manufacture and distribution of his tractors. At the Dearborn plant, which is temporary, 2000 men are now working, but this number will soon be increased to 25,000. Following the building of a permanent $3,500,000 plant, the distributing shop will be used as one of the numerous assembling plants.

Civilian Control for Airplanes

Authority to Be Taken from Military Officials—Program Must Be Speeded Up

WASHINGTON, March 14—Control over airplane production will, within a few days, pass entirely or almost entirely out of the hands of General Squier, and will be put in the hands of civilian manufacturers. Details of the plan have not been worked out, but the whole subject will be investigated by a committee of three, with H. Snowden Marshall as chairman.

The appointment of this committee followed the disclosure to the Senate Military Committee that only one-tenth of the airplanes promised by this country for service on the Western front early this spring would be ready by April 1. The request for this investigation was made by Howard Coffin.

Gifford Acting Director

Coincident with this announcement Walter S. Gifford, Director of the Council of National Defense, has been appointed Acting Director of the Aircraft Board and will have charge of executive details in the absence of Mr. Coffin who will go with the committee of investigation to see for himself just what conditions are. Mr. Gifford will retain his directorship in the Council of National Defense but spend his time at the Aircraft Board for the present. Howard E. Coffin stated to-day that despite all rumors good production is now had on the eight-cylinder Liberty airplane, and a number of the fighting planes of the twelve-cylinder type have been completed and are flying. He added that the production of the fighting planes would be in the thousands within the next few months.

Appropriation for 22,000 Planes

Congress originally voted appropriation for 22,000 airplanes of which 7000 are to be the light training planes equipped with engines other than the Liberty, and the other 15,000 are to be divided in quantities using the eight-cylinder and twelve-cylinder Liberty engine types.

The Senate Military Affairs Committee's investigation of the airplane program and other outside pressure are said to have had some influence in bringing the Presidential announcement of the new committee.

The aircraft board at present has no power over contracts nor engineering, but is supposed to stimulate production.

Curtailed Schedule Not Harmful

Has Clarified Industry by Allowing Factories to Make Definite Distribution Plans

DETROIT, March 11—The curtailed schedule which the National Automobile Chamber of Commerce has announced through its fuel committee and the War Industries Board, as reported in last week's issue of AUTOMOTIVE INDUSTRIES, has had a remarkably clarifying effect on the factories throughout the middle west.

The most tangible result which can be predicted by the factories here is a scarcity of cars during the summer. It is calculated that the output of the factories will not fill by 50 per cent the demand of buyers throughout the country for passenger automobiles.

The ruling made by the War Industries Board has had no internal effect on the factories, inasmuch as nearly all of them were working on a reduced schedule when the word of the definite curtailment order was received. Therefore, the only effect that the order had was to permit manufacturers to go ahead and outline their future policies with the dealers, in order to make as fair a distribution of their products as possible.

It can readily be predicted that the shortage in automobiles will begin to make itself keenly felt by the middle of May. March and April are bad for drive-aways because the roads through the factory districts are nearly all gravel, and a little sunshine and rain soon reduces them to a mass of mud.

With the embargo situation as it stands at present, although matters are somewhat easier than they were during the past months, it is difficult to obtain a small percentage of the freight cars needed to ship away the normal production of the factory. This contemplated shortage of freight cars and the difficulty in drive-aways make the car situation one without parallel in the history of the industry. It is certain that dealers who have not been foresighted sufficiently to lay in a stock of cars in advance are going to feel the pinch.

Far-seeing factory officials have noted that this will have a corresponding effect on the used car industry. As a result distributers in many cases have taken advantage of the lull in sales to fit up the used cars in presentable shape for spring and summer business. It has also been reported that syndicates in certain localities have been buying up used cars to create a modified corner on the market. Nothing definite, however, has been found out regarding this situation.

The automobile market is, of course, elastic in that purchasers do not require immediate delivery when they can keep on using their old cars after the time when they would ordinarily purchase a new one. The delay, however, only increases the coming market, as the potential demand is still there.

Some manufacturers believe that one of the possible effects of the curtailment order, coupled with the big demand which is sure to occur during the coming season, is that local assembling plants will spring up throughout the country, each attempting to fill the market immediately surrounding it.

The motor truck business is reported good everywhere. All the factories engaged in this business here are operating at top production.

Trucks are leaving singly and in trains from all points of Michigan to the South, East and West. Many go weekly by way of Toledo, and a plan is now being considered whereby all trucks bound for the seaboard will carry munitions. The plan is to load every truck to capacity with articles indicated by the government officials, and to deliver them at the seaboard. Then the truck will go to the eastern distributer who has ordered it. If carried out, this will relieve the railroad of thousands of tons of freight and will insure more prompt delivery of the truck than would be possible by freight car shipment.

—

Ford Sub-Chaser to Be Ready This Summer

WASHINGTON, March 8—The first submarine destroyer built by Henry Ford for the United States Navy will be ready for its trial trip early this summer. Several boats have been contracted for, but they will not be in quantity production until the one now under construction has been tried out.

—

Signal Truck Requires More Capital

DETROIT, March 13—The officers of the Signal Motor Truck Co. have notified stockholders that additional capital is required to carry the business forward successfully and profitably. It is stated in the notification that a proposition has been submitted by outside interests to supply credit up to $250,000 under the following general terms and conditions:

1. The par value of all common stock be decreased from $10 to $5 and that each stockholder be entitled to one share of the capital stock of the company so reduced in par value for each share now held by such stockholder; the balance thereof to be given as compensation for financial assistance offered.
2. The management and control of the company for the term of the agreement to be under the direct supervision of these interests which will receive 2½ per cent of the gross business transacted by the company as additional compensation.
3. The common stock of the company to be increased by 50,000 shares of $5 par value to be sold to these interests at their option at not less than par. Proceeds of such sale, if consummated, to be placed in the treasury of the company for the profit of all stockholders.
4. Preferred stockholders to agree to waive dividends and all rights thereto until Sept. 1, 1918.

As was recently reported in AUTOMOTIVE INDUSTRIES, the Paige-Detroit Motor Car Co. has made an offer to purchase the assets and business of the Signal Motor Truck Co. It is uncertain at the present time whether the stockholders of the Signal company will decide to continue the business for themselves, or will, on the other hand, sell out to the Paige company.

Studebaker Profits Decline

Drop of 60 Per Cent in 1917—Partly Due to War-Time Prices and Schedules

DETROIT, March 12—The report of the Studebaker Corp. and its subsidiary companies for 1917 shows total sales of $50,147,516, which is $11,841,078 or 24 per cent less than the 1916 amount. Net profits declined from $8,611,245 in 1916 to $3,500,741 last year, a drop of 59 per cent. The net earnings for 1917 amount to 9 per cent on the $30,000,000 common stock as compared with 26 per cent in 1916. Last August the dividend was cut from 10 to 4 per cent. A. R. Erskine, president of the company, attributes the heavy loss in gross business and profits partly to unsettled conditions after America's entrance into the war, and partly to the company's concentration of attention on government orders and shipments, with the result that the manufacturing schedule of motor vehicles was reduced, and the plant rearranged on a war basis. Cost of financing operations increased, and to carry the heavy surplus inventory investments, the company obtained bank loans which reached a maximum of $13,231,500, an increase of $7,000,000 over the average of 1916. Before the end of the year, this maximum was reduced to $7,400,000.

The net income account and consolidated balance sheet, as of Dec. 31, 1917, compare as follows:

	1917.	1916.	1915.

Michigan Buys 1000 Tractors

Ford Machines Will Be Sold Under Restrictions to Farmers by State

DETROIT, March 11—The State of Michigan has purchased from Henry Ford & Son 1000 Ford tractors for delivery beginning April 1. At the same time through Henry Ford arrangements were started for the purchase of a large number of plows to be attached to the tractors. These plows are made by the Oliver Plow Co., South Bend, Ind., and Mr. Ford has personally guaranteed that the state will be able to obtain them. The tractors and plows will be sold to the farmers of the state through the War Preparedness Board, and it is hoped that their use will increase the acreage of Michigan farms for 1918 crops. The tractors and plows will be under control of the board at all time, and will be used practically as community implements. The farmer who buys the machinery is expected to plow his neighbor's field, and the state will see that he does so.

Plan Suggested by Ford

This plan has been adopted at the suggestion of Henry Ford himself. In fact, it is stated that the sale of tractors and plows hinges upon this agreement. The amount of money involved in the transaction amounts to practically $830,000. The tractors are to be paid for at the rate of $750 each, while the plows cost approximately $100 each. Delivery is promised beginning April 1 at the rate of twenty-five a day, which will take one-quarter of the output of Henry Ford & Son's factory at that time. It has been further agreed that if the 1000 tractors prove insufficient, Henry Ford & Son will allow the War Board to have another 1000 at the same price, provided their distribution and use are as planned in agreement above mentioned.

Devising Distribution Scheme

The secretary of the War Board at Lansing is at the present time devising a scheme for distributing the tractors and plows. This contemplates sales by county agents, for cash only, but when a farmer buys the twin implement he makes a contract to plow his neighbor's field within a certain radius. This work, and the price for which it will be done, will be directed by the agents of the War Board. In this way the board believes the entire acreage of the state can be plowed.

Dearborn Meeting Held

A meeting was held at the Dearborn plant on March 9 with members of the State War Board present, to go over the details. At that time Henry Ford said that the state must see to it that the tractors and the plows are kept going from spring until fall. It is aimed to have neither the tractor nor the plow idle any longer than necessary.

From an acreage standpoint it is believed that the use of these tractors on a community basis will greatly increase the output of the Michigan farms. With 1000 tractors each able to plow an acre an hour, it would mean the maximum attainable effort of 1000 acres per hour, or 10,000 acres per day. The amount which the state will allow per acre for plowing is said to be about $2.

—

Detroit Valve and Detroit Brass Earn $348,424

DETROIT, March 11—The two units, Detroit Valve & Fittings Co. and Detroit Brass Works, operating as one corporation, earned $348,424.35 last year. Their gross sales amounted to $3,065,733, an increase of $411,554.56 over 1916, when the companies operated separately. After paying dividends amounting to $65,301.25 and setting aside $54,000 as reserve for federal income and excess profits taxes, the sum carried to surplus was $185,128.83. This increased the accumulated surplus to $295,200.78 on Jan. 1, 1918. The company's balance sheet shows:

Total resources	$1,710,846.28
Current assets	1,053,840.09
Working capital	838,744.59
Assets:	
Accounts receivable	322,216.40
Bills receivable	2,125.84
Cash on hand	31,255.61
Prepaid insurance	6,709.19
Inventory	691,533.95
Current liabilities:	
Accounts payable	60,095.50
Bills payable	155,000.00
Plant investment	657,005.29
Outstanding capital stock	1,146,550.00

Boston Has $10,000,000 Sales Show

BOSTON, March 8—More than 225,000 visitors and 3500 New England dealers attended the Boston show, which closed last night. A new record was made for sales during the week. Between the dealers signed up and retail orders, the volume of business done amounted to at least $10,000,000. One of the most noticeable factors was the tendency of passenger car dealers to obtain truck agencies in conjunction with their regular line.

—

Cleveland S. A. E. to Meet March 15

CLEVELAND, March 11—The next meeting of the Cleveland Section of the Society of Automotive Engineers will be held on Friday, March 15, at the Hotel Statler. Charles Tewksbury, of the Electric Tractor Co., will give a talk illustrated with slides and moving pictures on their creeper type of agricultural tractor.

—

Tractors to Haul Boats

WASHINGTON, March 11—Tractors will probably be used to haul boats carrying coal over the Chesapeake and Ohio Canal from Cumberland, Md., to the capital. Army officials are now surveying the canal to determine the feasibility of this plan and terminal facilities.

England Revises Gas Restrictions

Latest Regulations Allow Only 10 Gallons a Month for Commercial Cars

LONDON, ENGLAND, Feb. 16—The latest regulations with regard to the use of gasoline in connection with gasoline licenses limits the amount as follows:

Passenger Cars—No fuel for ordinary purposes designated pleasure cars. For business purposes not exceeding 10 gals. per month.

Motor Cycles—not exceeding 2 gals. per month.

Physicians' Cars—Not exceeding 50 gals. per month.

Commercial Vehicles—The amount depends upon the load-carrying capacity and the monthly mileage. The scale, which is a general guide for allowances, is as follows:

Useful Load, Tons	Miles per Gal.	Miles per Month	Gals. per Month
1	13	1,200	85
1½	11	1,100	95
2	9½	1,000	105
2½	8	960	120
3	6	900	150
4	5¾	900	155
5	5⅓	850	165
6	4¾	800	176

Delivery Wagons—For light-capacity delivery wagons 24 to 30 gals. per month.

Taxicabs—Forty to 60 gals. per month, according to the size of the city or town.

Passenger Buses—Approximately 45 per cent of the estimated requirements in June, 1916.

Renting Automobiles—Approximately 20 to 30 gals. per car per month, the amount depending upon the number of cars owned by the applicant.

In connection with the sale of gasoline, the Board of Trade, under the Defense of the Realms regulations, which limit the retail prices of all motor fuels, has placed a profit on gasoline sold by retailers at 10 cents per gallon above the cost. This order also limits the price of kerosene to 8 cents per gallon above its cost to the retailers.

For some time the price of gasoline has been limited to 15 per cent by agreement between the importers and the Motor Trade Assn., which is an organization of motor interests. The new order gives legal sanction to the price and also places the maximum profit at 10 cents per gallon.

Michigan Roads Meeting Postponed

DETROIT, March 11—The postponed annual meeting of the Michigan State Good Roads Assn. will be held here in September. The Michigan State Highway Department and the Highway Engineering Department of the State University will promote instructive features. The completion of the good roads system in Michigan will be considered and a tour of the highways of Wayne County will be a feature of the meeting.

England Trying to Evolve Suitable Tractors

Comprehensive Research Work Needed—Board of Agriculture Has Scheme for Establishing Institute of Mechanism

LONDON, ENGLAND, Jan. 15—The present tractor situation is creating a fairly widespread feeling in Great Britain to the effect that a great deal of comprehensive research work is needed in order to evolve tractors absolutely suited for use in the British Isles. The Board of Agriculture is busy with a scheme for founding an Institute of Agricultural Mechanism for the conduct of researches. It is conceivable that tractor manufacturers will also form a Research Association, with financial help from the Government. There is no branch of the motor industry in which a study of local conditions and the establishment of principles based upon those conditions is so necessary, and many machines which no doubt do admirable work in the districts for which they were primarily designed have secured by no means enviable reputations on British farms.

With regard to the question of whether farm tractors ought also to be suitable for road haulage, the general trend of opinion appears to be in favor of designing for field work only. A good deal depends on the modifications that may be made in British law as applied to road vehicles. At present springing of front and back axle is essential. This is probably also desirable from a mechanical standpoint, because the roads are hard and an unsprung machine shakes itself to bits very rapidly.

Tires and Rims Regulated

There are also stringent regulations, the operation of which is only temporarily suspended, as to the design of tires and rims. A tractor intended for general purpose work in Great Britain should be so designed that the spuds or other fittings can be very rapidly applied or removed. For road haulage, something nearly approaching a smooth tire must be provided. There must also be two independent systems of brakes, each adequate in itself to hold the tractor and its loaded trailer on a steep gradient upon a hard road.

Small fields are so common that there is much of the time wasted in turning at headlands, and a strong feeling is growing up in favor of the introduction of what might be called a double-ended tractor, running at equal speeds in either direction and working in connection with balanced plows.

It is too early as yet to attempt to indicate the degree of success attending the British Government's scheme for extensive ploughing by tractor, but one or two points of interest and importance are gradually emerging from a position that has been somewhat chaotic. It will be remembered that, following upon the demonstrations of agricultural tractors which took place in Scotland in October last, the Committee of Observers emphasized in its report the strong desirability of securing light tractors of ample engine power. It was stipulated that the ideal general purpose tractor for use in Scotland should develop not less than 20 B.h.p. and should weigh not more than 30 cwt. Many manufacturers on both sides of the Atlantic have adhered to the view that weight cannot advantageously be reduced to anything much below 2 cwt. per horsepower. It has been contended that, under many circumstances, any excess of power could not be utilized, but practical results appear to be going against this conclusion.

Must Be a Compromise

If we admit that the ideal arrangement would be to design one type of tractor for light land and another for heavy land, we are faced with the fact that both classes of land are not infrequently found in the same field. Therefore we must compromise, or else, when heavy land is encountered, we must use a plough with fewer breasts. The best compromise appears to be found in the light and powerful tractor, the wheels of which are fitted with a large number of spuds, fairly sharp and long but not very wide, and arranged in diagonal sets so that some are always getting a good grip. Blunt attachments waste power in compressing the soil, and spuds ranging from side to side of the rim are apt to get clogged up and to become inefficient.

Opinion generally is turning in favor of using a type of tractor suited to run with one driving wheel in the furrow. Under these circumstances it is felt that the lateral movement of spuds through the ground has generally a beneficial sub-soiling effect. Also that this position brings the wheel generally on to firmer and drier ground.

It is very difficult to get a reliable indication of the official view held in Great Britain on such points as those mentioned, but the writer is strongly of the opinion that the great majority of experts who have been concerned with the Government scheme of ploughing favor the light powerful tractor running with one wheel in the furrow.

On the subject of chain tracks and kindred devices opinions differ. The Committee of the Scottish Trials was not favorable to this method of propulsion, emphasizing the probability of rapid wear and tear and apparently failing to see any compensating advantage in improved foothold or reduced compression of the soil. Others equally qualified to judge regard the chain track as giving the best grip on a loose or slippery surface and as affording at least a fairly satisfactory means of avoiding the bad results of compression when heavy soil is moist or wet. Such soil, under these conditions, when subjected to compression form a paste from which a good seed-bed cannot be obtained and which may take years to eradicate. Such considerations are forcing us to a realization of the desirability of making fuller use of the speed capacities of farm tractors. This in turn means the employment of specially designed tractor ploughs in place of the old horse ploughs, the work of which is often very bad if they are hauled at more than 2 miles per hour. The great point is, of course, to make use of the adherent advantage of the tractor that it can, if given the chance, do its work very rapidly when weather conditions are such that the texture of the soil is just right.

—

Detroit-Pontiac Truck Line

DETROIT, March 12—Pontiac is connected with this city by a motor truck line operated and owned by the General Storage & Cartage Co., Inc., of Detroit. The present service is intended for bulk tonnage, but package service will be installed soon. Five motor trucks of from 5- to 10-ton capacity have been assigned to the service. The trip between the cities can be made in two hours, and the charge for service, in cents per hundred pounds, ranges from 9 cents for fifth class to 18.8 cents for first class deliveries.

—

2 New C. M. Lamps

DETROIT, March 12—The C. M. Lamp Co. is working on two new lamps—one for seaplanes and the other an acetylene lamp for tractors. The company reports its March business will be 100 per cent more than last month, and the February business was double that of January. An $800,000 government order for booster jackets was placed with the Kenosha plant and a smaller order was given the Detroit plant. The company states it has enough steel at both plants to last six months.

—

10 Munitions Districts for U. S.

WASHINGTON, March 13—To bring about decentralization, and closer contact with munitions manufacturers, the Ordnance Department has divided the country into munitions districts with headquarters for the different zones at Pittsburgh, Cleveland, Rochester, Boston, New Haven, Detroit, Cincinnati, Chicago, New York and Philadelphia. A district chief of production will be located in each of these cities.

—

Airplane Mail Service Delayed

WASHINGTON, March 12—The start of the airplane mail service between Washington, Philadelphia and New York will probably be delayed until May 15, because landing fields have not yet been found at Philadelphia and New York. It was originally planned to begin the service April 15, with army aviators as pilots and a daily trip between the cities each way. It is stated that the League Island field at Philadelphia was not found available, and a committee of army fliers and postal officials will begin investigation of other Philadelphia sites.

Digitized by Google

New York sites will be inspected after that. At present the airplanes require starting and landing fields 2000 ft. square, but the Post Office Department is experimenting with devices to allow starting and landing of airplanes on smaller fields and possibly on the roofs of large buildings.

—

Truck Supply Service Postponed

WASHINGTON, March 13—The proposed automobile supply service by motor truck between the Quartermaster Depot at Philadelphia and the Marine Camp at Quantico, Va., via Washington and Baltimore, has been postponed because of the bad road conditions between Quantico and Washington. It is possible this service may be established early in May.

—

Electric Storage Battery Earns 14 Per Cent

PHILADELPHIA, March 13—In a preliminary report of the Electric Storage Battery Co. for the fiscal year ended Dec. 31, 1917, net profits of $1,207,061 for the first half, or 14 per cent per annum on the common stock, are shown. Although the rate for the second half may not have been as high, and deductions for taxes may modify the final figures, the 1917 earnings are far beyond those of any other year. In 1916 this amounted to 9.7 per cent, in 1915 8.4 per cent, and before this averaged 7 per cent. Most of the company's expansion is represented largely by government contracts.

—

Overland Price Increase in April

TOLEDO, March 9—The Willys-Overland Co. has sent out a telegram to all dealers stating that all orders made after March 1 will be shipped and driven away during March if possible. After April 1 prices are scheduled for an increase, although no announcement is made regarding when the new prices go into effect or what the increase will be. C. A. Earl, vice-president of the Willys-Overland Co., has informed representatives of Automotive Industries that a price increase is certain after that date.

—

United States Truck Prices Raised

CINCINNATI, March 8—The United States Motor Truck Co. has increased its prices, to take effect on and after April 15. The prices follow:

Model	New Price	Old Price
E, 2½-ton chain drive..	$2,800	$2,650
H, 2½-ton worm drive..	3,250	2,950
D, 3½-ton chain drive..	3,500	3,350
J, 3½-ton worm drive..	3,950	3,650
K, 5-ton worm drive....	4,850	4,550

—

Vocational Training Outlined

WASHINGTON, March 12—The Federal Board for Vocational Education has issued Bulletin No. 7, which gives outlines and suggestions for a course designed to qualify men as skilled chauffeurs or motor truck drivers. The bulletin covers the complete course which is to be used in the various Army training schools.

Peerless Profits Are $1,065,869

Equal to 10.6 Per Cent on Common—Sales Aggregate $18,924,451, 39 Per Cent More Than 1916

NEW YORK, March 12—The annual report of the Peerless Truck & Motor Corp. shows net sales of $18,924,451, exclusive of munitions contracts, an increase of $5,399,428 over 1916. Profits, after the deduction of interest and reserve for depreciation, losses and taxes, amount to $1,065,869, or 10.6 per cent of the $10,000,000 outstanding common stock, as compared with $1,356,358, or 13 per cent, in 1916.

The consolidated balance sheet, as of Dec. 31, 1917, follows:

ASSETS

Land, Plant, Buildings and Equipment, Less Depreciation:		
Balance at Jan. 1, 1917.....	$4,891,680.43	
Net reduction during year...	713,518.10	
	$4,178,162.33	
Less: Amount charged off for depreciation for year.....	291,848.68	
Balance at Dec. 31, 1917.....		$3,886,313.65
Patents, franchises and good will, including cost of acquisition of stocks of subsidiary companies		3,710,520.00
Current assets:		
Cash in banks and on hand..		2,869,569.48
Marketable securities at current quotations		192,980.00
Inventories of finished product, work in process, raw materials and supplies valued at cost or market, whichever is lower		5,318,743.29
General Vehicle Co., Ltd., London, investment and current account, less reserve		63,412.68
Sundry debtors		111,298.69
Accounts and notes receivable, less reserves, including documentary drafts in process of collection, per contra		2,098,204.83
Total current assets		$10,654,208.97
Bankers' Trust Company, Trustee:		
Cash deposited under trust agreement to acquire balance of stock outstanding of The Peerless Motor Car Company		29,190.00
Deferred assets:		
Prepaid expenses and insurance		43,676.31
		$18,323,908.93

LIABILITIES

Capital		$4,898,110.20
Representing consideration received in cash for the following capital stock issued as full paid and non-assessable in terms of financial plans filed in accordance with the Statutes of Virginia:		
Capital stock authorized:		
400,000 shares of $50 each..		20,000,000.00
Whereof issued and outstanding:		
200,000 shares of $50 each..		10,000,000.00
The Peerless Motor Car Company:		
7 per cent cumulative preferred stock, outstanding in hands of public, 278 shares of $100 each.....		27,800.00
Funded debt:		
Peerless Truck and Motor Corporation Ten Year 6 per cent secured convertible gold notes		5,000,000.00
Subsidiary companies		280,000.00
		$5,280,000.00
Current liabilities:		
Accounts payable		1,264,413.81
Documentary drafts discounted, per contra..... ...		1,044,891.56
Sundry creditors and reserves, including reserves for Federal taxes.....		716,859.36
Total current liabilities ...		3,026,164.73
Special reserve for contingencies*		719,915.84
Surplus:		
Current surplus:		
Balance at Jan. 1, 1917 (whereof accrued prior to Nov. 10, 1915, $1,018,858.77)		2,575,595.87
Add: Net profit for the year, as per profit and loss account, after provision for estimated requirements for Federal excess profits tax and income tax, year 1917.....		949,483.27
		$3,525,078.64
Deduct: Dividends on preferred stock of The Peerless Motor Car Company in hands of public.....		1,946.00
Balance, Dec. 31, 1917.....		$3,523,132.64
Surplus capital, General Vehicle Co., Inc.:		
Balance at Jan. 1, 1917.....		848,785.52
Total surplus, Dec. 31, 1917.		4,371,918.16
		$18,323,908.93

The consolidated profit and loss account for 1917 follows:

Net sales, excluding munitions and special contracts of the the General Vehicle Co., Inc...	$18,924,451.88
Deduct: Cost of sales, including plant maintenance and repairs and depreciation of plant.....	17,621,833.55
Net income from sales	$1,302,618.33
Other income, including profit on special contracts of the General Vehicle Co., Inc., and interest earned	405,013.44
Total income	$1,707,631.77
Deduct: Interest on two year 6 per cent convertible gold notes	300,000.00
Depreciation in market value of investments and losses on investments sold	34,962.51
Federal excess profits and income taxes	306,799.39
Total deductions	$641,761.90
Balance	$1,065,869.87
Special reserve for contingencies	$116,386.60
Net profit for year carried to balance sheet	$949,483.27

To Drive 40 Marmons

INDIANAPOLIS, March 14—The first large driveaway ever held by the Nordyke & Marmon Co. will leave here Sunday for New York. Forty cars will be in line and will go via Columbus, Pittsburgh and Philadelphia over the Lincoln Highway. Last year the New York agency drove 15 or 20 cars, but got most of what it wanted by rail. This winter it secured a few by rail but now has been compelled to resort to the driveaway. Drivers are difficult to secure.

—

Marshall on Industrial Committee

WASHINGTON, March 12—In line with the general policy of the Secretary of War to keep thoroughly advised of the detail workings of the various departments of the Government and with the industrial conditions involved in the consummation of the various war programs, announcement is made of the appointment of a committee consisting of Snowden Marshall of New York, Edward Wells of the Babcock & Wilcox Co., and a third whose name will be announced later. This committee will make a broad survey of the Government's aeronautical program with particular relation to the industrial phases of the work.

Sell 3000 Overlands in South America

Argentine Sales Held Back by Labor Troubles and the Railroad Strike—Import Duties to Be Increased

NEW YORK CITY, March 8—Approximately 3000 Willys-Overland cars were marketed in the South American countries during the 1917 calendar year, according to Edward Rochette, South American representative of Willys-Overland, with headquarters in Buenos Aires, who has just completed a business trip in this country. Although Argentina has just harvested one of its best crops, as compared with the poor crop in 1916, the last automobile selling season, beginning in November and extending to the present, has generally been a disappointment to all Argentine dealers. The added buying value of the good crops has been offset by unsettled conditions due to labor troubles. There has been the additional problem of the relationship between Argentina and the Allies with regard to the purchase of the crop. The purchasing agreement was not settled until January, 1918, the middle of the selling season. Up to this point farmers did not know what they were going to realize from their crops and held back buying.

Railroad Strike Hurts Sales

The unfortunate railroad strike, which lasted more than 6 weeks, injured sales. It was not possible for distributers in Buenos Aires to drive automobiles overland to different parts of the country as it is possible in this country. Labor leaders would not allow specially hired chauffeurs to drive machines overland. It was possible only for the owner or his private chauffeur to do such work. Others attempting it were mobbed.

There was one bright side to the strike situation, namely, that sales increased in Buenos Aires so that business men could get out of the city to look after their affairs. Some of these men paid as much as $160 to be driven from Buenos Aires to the port of Bahia Blanca, a distance of 375 miles.

Import Duties to Be Increased

Cable dispatches from Buenos Aires, according to Mr. Rochette, indicate that the import duty on automobiles and parts will soon be increased 20 per cent. Up to the present the import on automobiles has approximated 12 per cent and that on parts approximated 45 per cent. The increased custom duties will increase sales resistance.

Argentina has not been suffering severely from lack of shipping facilities, and ocean rates were not as high as they were 2 years ago. The majority of cars pay 67½c. per cu. ft. A few were imported at a maximum rate of $1.15. Occasionally the rate was as high as 80 or 90c. per cu. ft. At present Willys-Overland is shipping cars via New Orleans, which costs approximately $5 per car more than via New York.

The question of the 56-in. tread in Argentina is far from being a settled factor, notwithstanding the ruling of American manufacturers that they would only supply this width of tread for South American countries. Road conditions in the Argentine camp or country have not improved in the last 2 years and the demand for the 60-in. tread is as great as ever. During the 1917 year Ford was generally supplying 60-in. treads, and so was Studebaker. They were apparently using up stocks of axles that were on hand previous to the agreement among American manufacturers. Overland is now obtaining what amounts to a 60-in. tread by use of a special design of wire wheel which places the tread of the tire 2 in. further out on each side. As the majority of American motor cars are sold in the country, the problem of the 60-in. tread is important.

A strong demand still exists throughout Argentina for magneto ignition, and Willys-Overland cars sold are so equipped. Studebaker is also providing a magneto. The demand for the magneto is due to the fact that, in country travel, cars frequently have to cross small streams, and the owner believes magnetos suffer less than batteries from the water.

Mr. Rochette is convinced that electric starting and lighting are essential and are wanted throughout South America. Troubles due to battery service are not retarding the sale of cars at present. Most of the battery service and repair work for Argentina is handled in Buenos Aires. P. A. Hardcastle, Willys-Overland distributer, who also has the agency for the U. S. L. batteries, has all repair work done at his depot.

Seven-Passenger Car Popular

The 7-passenger car continues to be the great seller in Argentina and Brazil. There is also a good demand for 5-passenger cars, but it is believed if every car offered for sale accommodated 7 passengers it would be in greater demand. Mr. Hardcastle at present has 120 dealers throughout Argentina, but these must not be thought of as dealers pursuing intensified selling methods like those of North American dealers. The Argentine dealer does not pay deposits on cars when they are ordered, but rather the distributer in Buenos Aires consigns the cars to them, and generally has to wait some time for his remittance after the cars are sold.

In the accessory field, American tire makers have the majority of the business, although such European tires as Michelin, Pirelli, Dunlop and the North British Clincher are selling well. The American trade is headed by Goodyear, followed by United States, Fisk, Goodrich, Firestone and Republic. Tire prices are considerably higher in Argentina than in the United States, a 34 x 4 casing retailing in Buenos Aires at $40 U. S. A. currency. As yet there is small demand for cord types.

Gasoline is now retailing at 55 cents U. S. A. money, per standard gallon. Due to the activities of the Bowser Co., the curb-side gasoline pump, which was introduced into Buenos Aires 2 years ago, has been making good progress.

Mr. Rochette reports that retail sales in Rio de Janeiro, Brazil, have been increasing in the past year and that the general condition of the city as a selling market is improving. This is due to the fact that 2 to 5 years ago Rio dealers were heavily stocked with European cars, which they were compelled to sell on long time payments. Many of these payments are now completed and American cars are now taking the place of the European models. The selling field in Sao Paulo, which is a better Brazilian field than Rio, continues good. Sao Paulo is on the edge of the great coffee belt, a night's ride by railroad from Rio, and this city as well as the fertile coffee land is also good. On the other hand conditions in Rio are different in that the city is surrounded by a mountainous area, and all sales are practically limited to the city and its immediate suburbs.

In a few of the leading South American cities, such as Buenos Aires, Montevideo, Rio and Sao Paulo, there is a slightly increasing demand for the sedan type of car for city use. This type, however, is too heavy for the country roads, and has not met with any appreciable demand.

—

Boone Tire Condition Satisfactory

CHIPPEWA FALLS, WIS., March 11—The Boone Tire & Rubber Co. is in an altogether satisfactory financial condition, despite reports published in local newspapers to the contrary. These reports were circulated by a disgruntled employee, and are disproved by the financial statement of the company. On Jan. 1, 1918, total fixed and current assets amounted to $259,275.18 as compared with total current liabilities of $77,655.09. Since the first of the year the assets have been increased by the additional sale of $50,000 of capital stock.

—

Illinois License Fee Increased

CHICAGO, March 9—Motor vehicle license fees in Illinois have been increased from 50 to 100 per cent for 1918, and a further increase will take place in 1920. License fee costs follow:

Vehicle	1917	1918	1920
Motor cycles	$2.00	$3.00	$4.00
10 H.P.	3.00	4.50	6.00
10-25 H.P.	4.00	6.00	8.00
25-35 H.P.	6.00	9.00	12.00
35-50 H.P.	8.00	16.00	20.00
Over 50 H.P.	10.00	20.00	25.00
Electric, under 2 tons	5.00	10.00	12.00
Electric, over 2 tons	10.00	20.00	25.00
Dealers	6.00	10.00	12.00

No Duty on War Supply Material

WASHINGTON, March 11—Raw materials, parts of equipment necessary to production of war supplies on which an import duty is now imposed will be admitted free during the war if an amendment offered by Senator Martin of Vir-

Digitized by Google

ginia to the deficiency appropriation bill is accepted. The amendment reads:

"During the present emergency, upon request made by the Secretary of War to the Secretary of the Treasury and under regulations to be prescribed by the Secretary of the Treasury, there may be imported into the United States without payment of duty thereon, raw materials, parts, or partly fabricated parts of equipment or finished equipment required to hasten the production of munitions or machinery of war or other necessary war supplies whenever such duty would otherwise be payable directly or indirectly from appropriations for support of the army."

Western Insurance Rates Changed

CHICAGO, March 9—New insurance rates and rules for motor cars on liability, property damage and collision policies, have been sent out to agents in the territory of the Western Underwriters' Conference, which includes the Central States. Hereafter there will be two policies offered for property damage, one giving the complete coverage without any deduction, for which a much higher rate will be charged than at present, and the other will be under a $100 deductible form, with a lower rate than for the present $25 deductible form.

The full coverage form, under the new ruling, does not have the $200 fire loss exclusion nor the old road bed exclusion, but covers every legitimate collision loss. The old form used to exclude loss by fire up to $200, and also exclude property damage caused by "collision with the road bed." There is no longer any differential collision rate between commercial cars and private passenger cars. Livery cars and other public cars, as well as demonstrators, will carry higher rates.

Washington Hangars for Liberty Planes

WASHINGTON, March 11—Hangars now being constructed in Potomac Park to accommodate two airplanes will house two Liberty airplanes, according to report. These airplanes, it is said, will make flights over Washington within the next few weeks to demonstrate their real ability.

U. S. Chamber of Commerce Meeting in April

WASHINGTON, March 8—More than 500,000 business men will be represented at the sixth annual meeting of the United States Chamber of Commerce, to be held in Chicago April 10, 11 and 12. The questions of financing the war, the railroad situation, centralized control of industry and the shipping problem will be discussed both from the point of view of filling the government's needs and that of causing a minimum disturbance in private industry.

Navy Agent Arrives in France

WASHINGTON, March 9—Lieutenant Commander Benj. Briscoe, United States Navy, has arrived in France, where he will have charge of specified construction for the navy.

4,500 British Trucks Run on Gas

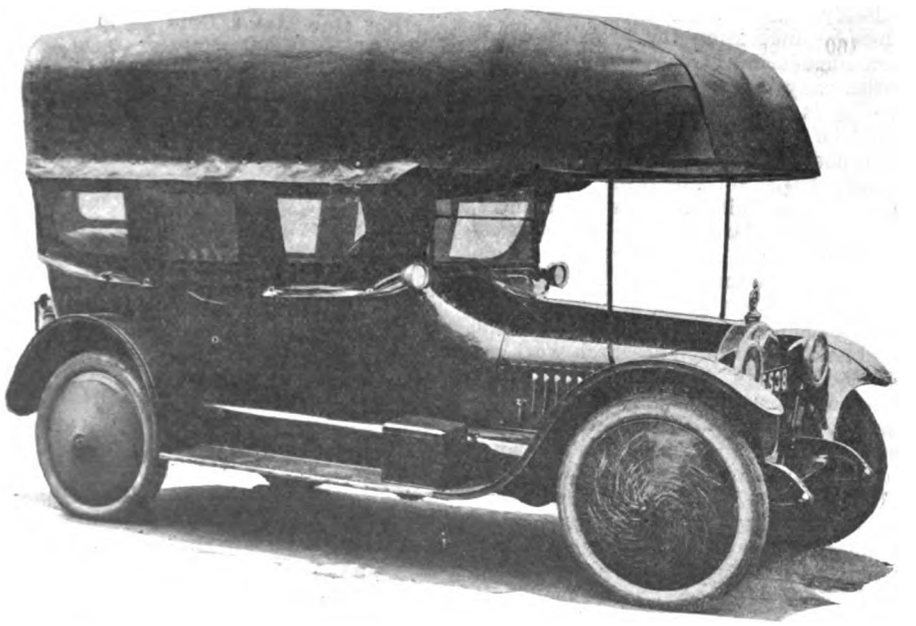
Only 4 Per Cent Is Supplied to Passenger Cars—Remainder for Business Purposes

LONDON, ENG., Feb. 14—At present, 4500 motor trucks are running on gas carried in large rubber gas bags, instead of using gasoline, and orders are on hand for gas containers for 2500 motor trucks which have not been able to obtain them up to this time. These figures indicate that gas will be used to a very large extent, not only because of its economy, but because the production of excess quantities of gas is inevitable from the process for the production of benzol from soft coal, which benzol will be then used as well as gasoline.

The production of gas is also certain because of coke manufacture, the coke being used in heavy commercial vehicles. This increased use of benzol and gas appeals to the motorist, in that it makes him independent of imported fuels, which is a consideration in days when ocean tonnage is at such a premium.

There has been some misunderstanding as to the use of gas, in that many people have concluded that it is being used by passenger cars to which the use of gasoline has been denied. The fact that only 4 per cent of the total deliveries of gas apparatus to date has been to owners of private cars indicates that the use of gas has been taken up by the business man for his motor trucks. Further orders of gas apparatus for passenger cars cannot be accepted, as the use of gas for cars is practically subject to the same restrictions as gasoline.

It is estimated that the saving of gasoline for business vehicles alone amounts to 3,000,000 Imperial gallons a year due to the use of gas.



Recently a gas traction committee was formed by the government to consider what further rules are necessary with regard to gas as a fuel. This committee will issue a report in a few weeks containing recommendations for the use of gas and flexible containers at atmospheric pressure, and will also indicate the limits of approved use under limited pressure in semi-rigid containers. The committee will also outline the necessary restrictions for the use of compressed gas at high pressures after the war.

Purchasing Agents Form Toledo Branch

TOLEDO, March 12—A branch of the National Assn. of Purchasing Agents has been established here as a result of an organization meeting and dinner. The charter of membership was signed up at the first meeting, and it is expected that this will be increased to 150 representing the largest industries in the city. F. J. Solon of the Owens Bottle Machine Co. is president. Other officers are: First vice-president, Mark Kuehn of the National Malleable Castings Co.; second vice-president, W. L. Flaherty of the Toledo Scale Co.; treasurer, R. H. Bradley of the Walding, Kinnan & Marvin Co., and secretary, R. A. Luedtke of the National Malleable Castings Co. Meetings of the new organization will be held twice a month. The national association has branches in the larger cities.

Flyers Study Ignition

CHICAGO, March 9—Several aviators are being sent to Chicago from the government aviation school to study magnetos. Squads of 8 student aviators are spending 2 weeks in intensive study at the Chicago branch of the Bosch Magneto Co. A third squad from the aviation school at San Antonio, Texas, is just completing its course, and it is expected that squads from the other flying camps will also receive this training.

British passenger cars operating with gas as a fuel have a large gas container bag attached to the top

Standard Gearing for Tractors

Minneapolis Section of S. A. E. Told of Necessity for This in Farm Work

MINNEAPOLIS, March 11—Laying emphasis upon the tremendous strain under which the gearing in a farm tractor is required to do its work, A. W. Scarratt, of the Minneapolis Steel & Machinery Co., stated in a paper read before the Minneapolis section of the Society of Engineers that a tractor transmission must do the work in one year that a passenger car transmission would do in 20 years. The title of the paper was Tractor Gear Teeth and Materials.

Mr. Scarratt deplored the lack of real engineering data as to gear teeth which would aid in conserving valuable material. Materials for gears are of a wide range, each of which has some advantage, and each tooth shape has some favorable point. In choosing a material it must have proper strength for the loads, proper hardness for service and proper dynamic qualities against impact and fatigue, and it is on the last point that there is a lack of information as well as on the strength of gear teeth.

The speaker suggested experiments for data on the relation of surface pressures and the degree of surface hardness necessary to produce a given service. Because of the various shapes of teeth no common rule can be employed to figure their strength. The most commonly used formula for these particular types of teeth is the Wilfred Lewis, but several large manufacturers do not adhere to the Lewis recommendations for allowable stress, because, considering the ability of chrome vanadium steel to resist impact forces as against cast iron, for instance, it is foolish to class them accordingly.

Besides increasing the pressure angle when considering strength of gear teeth another way of increasing load carrying capacity is to shorten the tooth. There should be a standard stub 20-deg. tooth which does not have definitely fixed proportions based on the pitch. The Fellows system fails in some instances, necessitating a larger pitch. In the present system there is no convenient or accurate formula for figuring the strength of these stub teeth. The speaker said there is room for great improvement and enlightenment through research work.

F. McDonough discussed a new form of hydro-automotive transmission as patented by Joseph Rosche, a device for the commercial realization of hydraulic transmission as applied to motor vehicles. It is a step toward eliminating weaknesses in principle which are native to the present system generally utilized on automobiles and trucks, and which is saved from failure by finest materials, workmanship and detailed engineering design.

Solution of the problem of an efficient and flexible transmission for motor-driven vehicles seems to have been reached in the perfection of a hydraulic transmission. Driving and driven cylinder pistons are stationary when both are rotating at the same speed. It has no revolving surfaces coming in contact, all cylinders being integral in one casting.

—

Motor Products Earnings $537,527 in First Year

DETROIT, March 14—The Motor Products Corp., Detroit, made during 1917 net profits of $537,527, of which $233,333 has already been paid in dividends. This is the end of the first full fiscal year ending Dec. 31, 1917. The corporation has no liabilities except its current monthly accounts. Assets in the nature of cash, sound accounts receivable and land contracts amount to $2,919,967.

The corporation's sales for the year have amounted to $9,633,082, which is an increase over the previous period of 48.6 per cent. This increase does not include any Government or war orders and covers a term in which the corporation's affairs were consolidated by the bringing of four of its manufacturing plants into the newly acquired Lozier plant.

No provision has been made in the above earnings for federal taxes, and it is estimated that they will be $80,000 or $100,000. Government business for the future has been obtained to the amount of $5,500,000. Orders have also been obtained for new business to the amount of $2,000,000.

The balance sheet shows assets of $5,049,072, of which $2,725,390 are current and $2,520,720 are fixed. The company has a main factory at Detroit and branches at Ann Arbor, Mich., and Walkerville, Ont.

—

How One Maker Gets Freight Cars

DETROIT, March 9—As a corollary to the freight car shortage and the problems which it has brought about, it is reported that one Detroit manufacturer of cars has been given permission by the government to use a certain number of freight cars with the understanding that they are to be sent into the grain belt. Thus the empties can be used for sending foodstuffs back East.

—

Car Equipment Company Bankrupt

DETROIT, March 9—The Universal Car Equipment Co., maker of body and top equipment, such as fenders, tire holders, radiators, shields, etc., has been adjudicated bankrupt, and its equipment will be sold at auction on March 11 in Detroit. Creditors have been notified that they should be prepared to close up their business with the bankrupt corporation on March 12. The property for sale at auction is valued at $2,953.50. The sale has been called by Lee E. Joslyn, referee in bankruptcy.

Bureau at Capital Proposed

But Plans of N. A. C. C. and M. A. M. A. Are Immature Yet—Production Census

WASHINGTON, March 12—At this time and until the meeting of the Motor & Accessory Manufacturers' Association this coming Friday, plans both of Hugh Chalmers and A. W. Copland, members of the Automobile Industries Committee, recently dissolved, are uncertain. Mr. Chalmers has a number of matters to be cleared up that concern the committee, and Mr. Copland does not yet know whether his committee will be continued with him in charge or not.

Reports have it that the committee will in all likelihood continue to represent the M. A. M. A. here. Mr. Chalmers stated to-day that he will endeavor to organize a sort of clearing house and bureau of information for the automobile and truck manufacturers.

As the offices of both organizations are now located jointly in two buildings, the Ouray Building and the Second National Bank Building, action will have to be taken at the coming meeting to decide which offices will be occupied by each.

The National Automobile Chamber of Commerce is sending to each manufacturer of automobiles a blank statement to be filled in and returned to the National Automobile Chamber of Commerce, showing the number of cars produced since the beginning of the fiscal year, materials on hand, commitments, and what production would be without curtailment and what it will be with a 30 per cent curtailment arranged between the Fuel Committee of the industry and the Fuel Administration.

The Chamber will file these reports with the War Industries Board, which, where they are not sworn to, will retain the right to order special investigations of any company or companies.

—

Jones Prices Increased

WICHITA, KAN., March 11—The factory prices of Jones passenger cars will be increased on March 15 as follows:

Model	New Price	Old Price	Increase
7-passenger touring 26B—(Lewis engine)	$1,775	$1,675	$100
5-passenger roadster 26A—(Lewis engine)	1,775	1,675	100
4-passenger sport type 26C—(Lewis engine)	1,775	1,675	100
7-passenger touring 27A—(Continental engine)	1,875	1,675	200
4-passenger roadster 27A—(Continental engine)	1,875	1,675	200
4-passenger sport type 27C—(Continental engine)	1,875	1,675	200

—

Oakland Models Increased $60

PONTIAC, MICH., March 12—An increase of $60 in the price of all Oakland models went into effect March 1. The prices follow:

Model	New Price	Old Price
Town car	$2,000	$1,940
Unit body sedan	1,550	1,490
Convertible sedan	1,250	1,190
Roadster coupe	1,210	1,150
5-passenger touring	1,050	990
3-passenger roadster	1,050	990

Transport Committee Urges Extensive Work

WASHINGTON, March 13 — Indications point to an unprecedented development of highway traffic in 1918, as a result of the nation-wide effort that will be made to keep roads open every day in the year. Last year storms frequently killed travel over urgently needed roads, isolated many farms and struck a severe blow at the nation's war preparations. Short-haul freight which could not be handled by already over-taxed railroads, but which could have been diverted to clear highways, was piled up in immense quantities.

The foregoing facts are given by the Highway Transport Committee as a few of the arguments why it is a patriotic duty to keep all roads open at this time. State, municipal, county and township organizations should be concentrating on plans to safeguard traffic against all of the interruptions that were met last winter. Sufficient machinery and horses are on hand to do this, the main difficulty being to get a quick start.

—

10 Per Cent Dividend Paid by Alter Motor

DETROIT, March 11 — The Detroit Trust Co., trustee for the Alter Motor Car Co., Plymouth, Mich., is distributing an initial dividend of 10 per cent to creditors, realized on the sale of the property. Liabilities were $25,000, and it is expected the creditors will receive not more than 25 per cent.

—

Demand for Automobile Body Lumber

ST. LOUIS, March 13—Hardwood lumber manufacturers here, who sell largely to automobile body-builders, say that more orders are being received now than for several months past. Large buyers are convinced that sap gum will not answer for body building, and that manufacturers are returning to ash, and to maple for cheaper bodies. Prices of maple and thick ash have been advanced, the former because of an insufficient supply, and the latter as a result of the heavy use in airplanes and vehicles. Automobile body ash, less than 2-in. in thickness, is quoted at $80 for first and seconds, and $64 for No. 1, as compared with $58 and $35 a year ago.

—

Liberty Planes En Route to Washington

LAKE CHARLES, LA., March 13—Two Liberty airplanes have been shipped from here and are en route to Washington, where they will receive flying tests.

—

2200 Scripps on Order

DETROIT, March 12 — The Scripps-Booth Co. has on its books unfilled orders for 2200 cars of its new model. The company puts out 20 cars a day, half of which are of the old four-cylinder model.

—

Kelly-Springfield Reduces Stock

CLEVELAND, March 13—At the annual meeting of the Kelly-Springfield Tire Co. it was voted to reduce the 6 per cent cumulative first preferred stock to the extent of $248,900 in accordance with the plan described in a recent number of AUTOMOTIVE INDUSTRIES. The retiring directors of the company were re-elected at the meeting.

—

Jacobson Machine Now Warren Products

WARREN, PA., March 13—The Jacobson Machine Mfg. Co. will hereafter be styled Warren Machine Products Co. Formerly the company concentrated on the manufacture of gas engines, but this has become a minor activity, and the style was changed so that it would suggest the main products.

Plan Tractor Demonstration in Vicinity of Wilmington

DOVER, DEL., March 13—The Kent County Farm Bureau, the official link between the Government and the farmers of the central county of the State, has arranged for a tractor demonstration to take place in this vicinity for 3 days during the week of April 15. It is hoped that this will attract not only Kent County farmers, but those in the other two counties of the State. Demonstrations in plowing, fitting and preparing the land will take place each afternoon, the mornings being allowed for examining the machines. An invitation has been extended to all tractor manufacturers with agencies here to take part in the demonstration. Seven have responded and each, it is expected, will exhibit several different types of machine.

—

International Harvester Tractor Schools

GRAND RAPIDS, MICH., March 13—The International Harvester Co. of America has established three tractor schools in this state to educate operators in handling tractors more efficiently. More than 90 per cent of tractor troubles are caused by lack of knowledge on the part of the operator and can be avoided if the operator learns the general construction of an internal combustion engine.

—

Army Laundry on Trailer

WASHINGTON, March 11—The first portable army laundry built to accompany an army and wash clothes for soldiers in the field arrived here yesterday. The plant, invented by J. F. Broadbent, consists of a steam tractor and standard laundry equipment mounted on a trailer.

Men of the Industry

Changes in Personnel and Position

Elgin Motor Elects Rieman as President

CHICAGO, March 11—C. S. Rieman has been elected president and general manager of the Elgin Motor Car Corp., which he founded 2 years ago. He has been vice-president and general manager of the company since its organization.

—

Donald W. Whittaker has been appointed advertising manager of the Acason Motor Truck Co., Detroit. Formerly he was assistant advertising manager of the Federal Motor Truck Co. and sales manager of the Detroit Truck Co.

—

H. J. Montgomery, superintendent of production for the Advance-Rumely Co., Laporte, Ind., has resigned.

—

H. O. Bernhardt, formerly production manager of the Harroun Motors Corp., Wayne, Mich., has received the commission of major in the Ordnance Department. He will be connected with the central bureau supervision section.

—

Joseph W. Gardham, formerly technical representative of the Chalmers Motor Co., is now in charge of tests of motor trucks for the Militor Corp., Jersey City, N. J.

—

E. R. Jacobi has resigned as chief inspector of the Reo Motor Car Co. and has joined the Mitchell Motors Co., Inc., Racine, Wis.

—

N. W. Barton, formerly manager of the Chicago branch and assistant general sales manager of the Olds Motor Works, has been promoted to the position of eastern division sales manager. His headquarters will be in Lansing.

—

G. D. Yeager has been elected president and general manager of the Wagner Axle Co., Anderson, Ind., to succeed H. P. Harding, who resigned.

—

G. A. Freeman has resigned as vice-president of the J. C. Wilson Co., Detroit, and has joined the airplane body division of the C. R. Wilson Body Co., Bay City, Mich.

—

Andrew Lehr, formerly with the Studebaker Corp. of America, has been elected vice-president of the J. C. Wilson Co., Detroit.

—

Horace T. Thomas, chief engineer of the Reo Motor Car Co. since its organization, has been appointed a member of the committee which will design and perfect the new standardized ¾-ton government truck. He will work at Washington, and take his place among the "dollar-a-year" men. The Reo company has ordered that his title and salary be continued through the war.

—

Clarence S. Walker has been appointed patent counsel of the Wire Wheel Corp. of America, Buffalo. He formerly held a similar position with the Packard Motor Car Co.

—

G. G. Germaine has been appointed district representative in New England for the Standard Parts Co., with headquarters in Boston. He was formerly associated with the Kawneer Mfg. Co.

—

F. J. Bury, service expert of the Packard Motor Car Co., Detroit, who has been connected with the St. Louis Packard company for some time, has resumed work at the plant.

—

C. W. Inches has resigned as assistant purchasing agent of the Briscoe Motor Corp., Jackson, Mich., to become purchasing agent of the Trego Motors Corp., New Haven, Conn.

—

W. Whitney Slaght has been appointed experimental engineer of the Pierce-Arrow Co., Buffalo.

—

Raymond V. Morris has been appointed general manager of the Savage Tire Co., San Diego, Cal. He was formerly connected with the Curtiss Aeroplane & Motors Corp.

—

N. J. Fitch has been appointed manager of the Detroit branch of the Bearing Service Co., succeeding E. G. Volker, who has been promoted to the position of manager of the New York branch.

—

E. W. Dobson has been appointed factory manager of the Standard Motor Truck Co., Detroit. He was formerly in charge of the truck department of the Packard Motor Car Co. and later was with the Continental Motor Co. and the Hercules Motor Co.

—

H. L. Innes, factory manager of the Chevrolet Motor Co. for the past year, has been transferred to General Motors headquarters in New York. Thomas Houghton, formerly with the Durant-Dort Co., the Dominion Carriage Co. of Toronto and the Tarrytown plant of the Chevrolet, will succeed him in the Chevrolet plant at Flint.

—

Frank A. Hayes, formerly engineer with the Willys-Overland Co., Toledo, has been appointed chief engineer of the Willys-Overland, Ltd., Toronto, Ont.

—

Henry C. Limbach, former production manager of the Zenith Carburetor Co., is now equipment engineer of the Strong, Carlisle & Hammond Co., Detroit.

—

E. R. Parker, formerly vice-president of the J. R. Holland Automobile Co., has been appointed southwestern district sales manager of the Saxon Motor Car Co., Detroit.

New Companies Formed

Latest additions to ranks of Automotive Industries

Truss Type Inner Tubes Coming from Cincinnati

CINCINNATI, March 9—The Ross-Lambert Rubber Co. has been organized, with an authorized capital of $3,000,000, to manufacture inner tubes of a new model styled the truss type, and other rubber accessories. The company is negotiating for a site near Cincinnati, and the directors hope to have a plant in operation in 2 months. It is reported that a large order from the British Government has been received. Officers are: Charles E. Ross, Columbus, president and general manager; C. H. Lambert, Hartwell, Ohio, vice-president and secretary, and A. B. Lambert, treasurer.

—

Automotive Engineering Corp. Formed

BUFFALO, March 12—The Automotive Engineering Corp. has been incorporated here with a capital stock of $125,000 to manufacture carbureters and engines. H. R. Richards, E. McM. Mills and M. C. Spratt are the incorporators, and will have offices for the present in the Fidelity Trust Building.

—

To Make Converters for Fords

YOUNGSTOWN, O., March 11—The Lauton Truck Co. has been organized here by A. W. Lau to make converters for Fords and other light cars, and Cadillacs to make them into 1 and 2-ton trucks. The company plans a production of from 7500 to 10,000 units the first year. The first shipment of these was sent East last week. Associated with A. W. Lau are W. R. Kirby, of the W. B. Pollock Co., and J. W. Riddle. M. D. Davidson will be sales manager.

—

Johnson Wheel Co. in South Bend

SOUTH BEND, IND., March 9—The Johnson Motor Wheel Co., recently organized with $100,000 capital, will have its plant and principal office here. The company will manufacture gas engines.

—

Johnstone Tire Ready for Production

SOUTH BEND, IND., March 9—The Johnstone Tire & Rubber Co., organized under the laws of this state, has almost finished equipping its building at Laporte, Ind., and will begin the manufacture of semi-solid and solid truck tires before the end of the month. C. W. Mussey, formerly treasurer of the company, was elected president. E. G. Bird was re-elected secretary and B. R. Blackwelder vice-president. A. A. Peterson will be factory manager and superintendent.

Digitized by Google

A. A. A. Control for Racing

Contest Board Has Again Taken Hold of Competitions—Status Same as Last November

NEW YORK, March 9—The Contest Board of the American Automobile Association has again taken hold of motor-car contests, and will immediately resume its control of contests, as it has done for years past.

In November the Contest Board decided not to sanction any more contests during the period of war exigency, due to the insistent demands of the government for skilled mechanics well qualified as motor experts for aviation and other services. The action at that time was taken because of an official letter from the government on the subject.

It has developed that the government department has not the power to stop the sport, as was anticipated, although such power may be forthcoming in the future. It was rumored that gasoline would not be allowed for racing purposes, but the Fuel Administration has no power to enforce any such rule were it promulgated. It was also rumored that the Railroad Administrator would not allow racing motor cars to be shipped on railroads, but even that action would not stop racing, as the cars could be driven overland from one speedway to another.

The present action of the Contest Board in again taking up the control and sanctioning of races came from race promoters, who asked for such protection. Some of the leading promoters soon realized how valuable and necessary it is to have an impartial controlling body such as the Contest Board. It is a great protection to the promoter both as regards his arrangements with drivers and with entrants. As a result of this, as well as because of the Washington situation, it was voted at a meeting of the Contest Board, held to-day, to immediately resume control. This means that everything is back just where it was previous to the action taken last November, when it was decided not to sanction contests during the war period.

Already a complete schedule of races for several speedways has been prepared by the speedway interests, and these will be sanctioned and handled under the regular rules. The Contest Board offices have been reopened in the Bankers Trust Building, corner of Fifth Avenue and Forty-second Street, and Chairman Richard Kennerdell is in charge, with the same board assisting him as formerly.

William L. Wellman, race promoter, has a complete schedule of races, extending from early in May until October, and embracing such speedways as Sheepshead Bay, Chicago, Uniontown, Providence, Cincinnati, and perhaps Philadelphia. The schedule is not complete, but embraces the following definite dates:

Uniontown, Pa.	May 16
New York	May 30
Uniontown	Aug. 3
Providence	Aug. 17
New York	Aug. 17
Uniontown	Sept. 2
New York	Sept. 21

Other speedways with which arrangements are not yet completed are expected to take in other important dates not included in this schedule.

There seems to be nothing definite with regard to the Philadelphia speedway, and it is questionable if it will be completed in time for any racing. Lumber that was intended for the construction of it has been taken by the government, and to date none of the lumber construction work has been started. The necessary grading for the construction work has largely been completed.

The three big meetings selected for the summer are May 30, Aug. 17 and Sept. 21, all in New York. The Harkness cup race on Sept. 21 will be the closing event of the year. New York also has the Decoration Day race, which heretofore has gone to Indianapolis.

There will not be any racing on the pioneer Indianapolis speedway, as Carl G. Fisher, president, as well as James Allison, F. H. Wheeler and A. C. Newby, the stockholders of it, announced last year that they were out of racing for the period of the war, and that none of their racing cars would enter in any contests. The only contests Indianapolis would stage would be benefit races, where all of the receipts would go for war benefits.

—

Sutphen President of Engine and Boat Association

NEW YORK, March 11—Henry R. Sutphen, president of the Electric Boat Co., was elected president of the National Assn. of Engine and Boat Manufacturers at the March meeting of the executive committee. He will succeed John J. Amory, who had been president of the association since its organization in 1904. The following officers were also chosen for 1918: John J. Amory, president of the Gas Engine & Power Co. and Chas. L. Seabury, Consolidated, first vice-president; Percy C. Jones, of the S. M. Jones Co., Toledo, second vice-president; Charles A. Criqui, president of the Sterling Engine Co., Buffalo, third vice-president; James Craig, owner of the James Craig Engine & Machine Works, treasurer, and Ira Hand, secretary.

—

Dearborn Urged as Residence Section

DEARBORN, MICH., March 12—Members of the Board of Commerce here are urging Ford tractor employees to build their homes in Dearborn instead of commuting from Detroit and points in this vicinity. The plant of Henry Ford & Son is constantly employing an additional number of men and its assured permanency is given as the main reason for urging employees to reside in this vicinity. The village of Dearborn is growing rapidly and is becoming a permanent industrial center.

Tractor Competition for England

Food Production Department Plans Sectional and National Contests

LONDON, ENGLAND, Feb. 15—A comprehensive schedule of tractor-plowing competitions which are largely sporting competitive affairs has been started in England. This is the result of an experiment tried in several districts by the Food Production Department to increase the acreage plowed by tractors to the maximum.

The scheme as now outlined for the entire country consists of a series of sectional and national competitions as follows: First for units; second for counties; third for the whole of England and Wales.

Each competition will continue for 1 month. The first competition begins Feb. 9, the second on March 9, and the third on April 6.

This schedule means that there will be three monthly competitions for each unit. There will be three for each county and three national ones. Additional men and machines will be admitted to the competition so that they may be added to the nation's agricultural tractor power during the spring plowing season.

The details of this threefold competition are:

1. For each unit—A distinctive flag to be carried on the tractor will be awarded to the tractor team in each unit which plows the greatest number of acres during each period of 4 weeks. This flag will be presented each month by the tractor representative of the county.

2. For each county—A championship flag will be awarded to the tractor team in each county which plows the greatest number of acres during each period of 4 weeks. A distinctive badge will also be worn by each member of the winning team. The flag and badges will be presented each month by the chairman of the county executive committee.

3. For England and Wales—A championship shield to be carried on the tractor will be awarded to the tractor team which plows the greatest number of acres in England and Wales during each period of 4 weeks. A small silver replica of this shield will also be given to each member of the winning team. The shield and replicas will be presented personally by the Director-General to the winning team, which will be invited to London for the purposes of the presentation.

Each trophy will be held for 4 weeks only, unless it is won again by the same team.

The complete scheme of competition not only awards those doing the most plowing but gives a national significance to the movement which results in increased plowing at a time when a national stimulant is imperative.

Commerce Motor Car Co. Ready to Start Production

DETROIT, March 11—The Commerce Motor Car Co. will start production immediately on its $2,000,000 government contract for 1-ton trucks. All material required has been purchased or contracted for at prices which insure a satisfactory profit. The directors have authorized the sale of $100,000 of treasury stock at $10 par, and one of these will be offered to each shareholder for each three held by him. The entire amount has been underwritten by Walter E. Parker, president of the company.

—

Assembling Plant for Continental Motors

MUSKEGON, MICH., March 9—The Continental Motors Corp. is erecting a new building for assembling and block testing, which will be ready May 1. The Detroit plant reports an increase of 10 per cent in production during the last 2 weeks.

—

Eagle Tractors Shipped to Italy

APPLETON, WIS., March 9—The Eagle Mfg. Co. last week made its first shipment of one carload of farm tractors to Italy on a large order from the Italian Government. The company is now finishing its new factory, which will be devoted exclusively to tractor manufacture. The original plant will be used for gas engines and other farm machinery.

—

Bearings Service Co. to Move

DETROIT, March 9—The Bearings Service Co. will move soon into new and larger offices at Cass and Willis Avenues. The Detroit service branch of the company will be located in the same building.

—

Westinghouse to Sell Frankel Connectors

PITTSBURGH, March 13 — The Westinghouse Electric & Mfg. Co. has obtained the exclusive sales agency for all of the United States for Frankel solderless connectors, used for joining wires and cables. The Frankel Connector Co. has increased its facilities to care for the new business which will be obtained through the Westinghouse sales organization. The latter will also distribute Frankel testing clips.

—

Cleveland Westinghouse Branch Moves

CLEVELAND, March 11—The district sales office of the Westinghouse Electric & Mfg. Co. here is now located in new quarters at 1900 Euclid Avenue.

—

Liberty Drive Outboard Motor Marketed

DETROIT, March 13—The Caille Perfection Motor Co. is putting on the market a new little outboard motor for rowboats. It will be called "Liberty Drive," and will retail for $48. Power is transmitted direct from the crankshaft to the engine, and the latter is mounted on a swivel so that the boat can pass over an obstruction without causing damage to the propellor blades.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

—

Canadian Electric to Sell Defender Lock

DETROIT, March 11—The Canadian General Electric Co. has been appointed sole distributer of Defender Auto-Lock Co. products in Canada. On April 1 the retail price of the Defender auto-lock will be raised to $4 in the United States and $5 in Canada.

—

Hotz Foundry to Double Production

FREMONT, OHIO, March 9 — The Hotz Foundry & Mfg. Co. has erected an addition to its factory and installed extra machinery and equipment. Present production will be doubled.

—

90 Factories Making Liberty Truck Parts

WASHINGTON, March 12—Ninety factories are working to capacity on the standardized parts for Liberty trucks, according to reports received this week by the motor transport division of the War Department. The entire schedule will have been completed before Aug. 1.

—

Capital Increase

DETROIT, March 5 — The Acason Motor Truck Co. has increased its capital stock from $50,000 to $200,000.

—

Dividends Declared

PHILADELPHIA, March 9—The Electric Storage Battery Co. has declared a dividend of $1 a share on common and preferred stock, payable April 1 to stockholders of record March 18.

—

TOLEDO, March 9—The Willys-Overland Co. has declared a regular quarterly dividend of $1.75 a share on preferred stock, payable April 1 to stock of record March 20.

—

The International Harvester Co. of New Jersey has declared a regular quarterly dividend of 1¾ per cent on the common stock, payable April 15 to stock of record March 25. Prior to this time the stock has been on a 5 per cent per annum basis.

—

Paige Ultimatum to Signal

DETROIT, March 14—The Paige-Detroit Motor Car Co. has sent the Signal Motor Truck Co. an ultimatum, asking for an immediate answer on its offer to purchase the Signal plant. A reply is expected before Saturday.

New Engine Made By Golden, Belknap & Swartz

DETROIT, March 13 — Golden, Belknap & Swartz Co. is working on a new heavy duty type engine for trucks and tractors. It is expected that the model will be ready within two weeks. The cylinders are cast singly and have overhead valves, and the engine has the forced feed oil system. The retail price will be approximately $300. The company expects to produce 5000 of the old model engines during the balance of the year.

—

New York Office for Bourne

NEW YORK, March 12—The Bourne Magnetic Truck Co. has removed its factory and offices to Fifth Avenue and 142d Street, New York.

—

Lozier Making 5 Cars Daily

DETROIT, March 14—The Lozier Motor Car Co. is still making cars on order, and production, according to reports, is five a day. The company has orders for 6 months.

—

Jenkins Spring Offices Moved

ST. LOUIS, March 10—The general offices of the Jenkins Vulcan Spring Co. were moved from here to Richmond, Ind.

—

Lawson Aircraft to Move

GREEN BAY, WIS., March 12—The plant of the Lawson Aircraft Corp. will in all probability be moved from here to Milwaukee. This was practically decided at a conferene held in Milwaukee last week between representatives of banks, the Assn. of Commerce, the County Council of Defense and officers of the company. The Lawson company was organized 8 months ago, and recently moved into a new plant. This second change of location is necessitated by need for greater facilities and capital.

—

D. W. Burke Buys Auto Electric Service

DETROIT, March 11—D. W. Burke has bought out and will operate the Auto Electric Service Corp., the official representative and service station for the Bijur, Auto-Lite, Dyneto, Westinghouse, Eclipse, Bendix, Tillotson Carbureter, Heinze-Springfield Ford Starter, Atwater-Kent, Berling, Connecticut, K-W ignition, Philbrin and Norma Bearing companies. Burke was formerly superintendent of automobile service of the Westinghouse Electric & Mfg. Co., Pittsburgh, and president of the Automotive Equipment Service Assn.

—

Must File Bijur Claims April 15

NEW YORK, March 13—The receivers of the Bijur Motor Lighting Co. have given notice to all creditors of the company to assert their claims on or before April 15 in written form with proper verification. These must be filed with the receivers at the office of White & Case, 14 Wall Street.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Good Weather Eases General Coal Situation

Prevailing good weather has brought about a general easing up of the coal situation. The worst of the domestic distress is now over, and there is practically no suffering. New England, however, is still facing the problem of procuring an adequate coal supply—a problem that will not be solved till more ships are pressed into service. The shipping now available totals about 216,000 tons, as against the 351,000 tons considered necessary to meet the normal needs of this territory.

Though showing progressive improvement from week to week, the supply of cars to the mines is still not what it should be, and operators are unable to produce at maximum capacity. The bituminous mines in the central Pennsylvania district are the greatest sufferers from this lack of cars, the miners in that region working only part time. The loaded coal cars that figured in the recent rail congestion are now being returned from tidewater, and the near future should show a decided increase in the number of empties sent to the mines.

Anthracite Deliveries Improve

Deliveries of anthracite by rail continue to pick up, though river shipments are little better than the February average, and receipts at tidewater are about normal. There is an active demand for steam sizes, with no free coal to be had from the large operators. The western markets are insistent in their plea for every pound of hard coal, as the government has intimated that after April 1 these markets will be asked to use bituminous coal from nearby regions.

Owing principally to the shortage of cars, the supply of bituminous coal continues to be unequal to the demand. True, there is a slight increase in production over previous weeks, but every ton is being quickly swallowed by a hungry market. Dealers are unable to accumulate reserve stocks as in former years, and it is hard to say when the shortage in soft coal will be overcome.

Plans for Distribution

Much speculation exists regarding the many plans for zoning and distribution. The government's new price schedule is also awaited anxiously by the operators; and as for the dealers, they are marking time and wondering what will be in store for them after April 1, the government having shown that it is actually in control of both the wholesale and retail branches of the business.

There is practically no contracting for the new year, which begins April 1. Consumers, of course, are eager to provide for their next winter's requirements, but government regulations are against contracts unless the operators are willing to sign up at the present Federal prices. Furthermore, another hindrance to the making of contracts is the fact that they are subject to cancellation if the authorities desire to confiscate the coal for government purposes.—*Coal Age.*

A New Service

Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

To Fix Steel Prices at Washington March 20

The naming of Wednesday, March 20, as the day for the price conference at Washington between the steel manufacturers and the War Industries Board is bringing to a head the issues raised by various producers. The diverse interests of the small producers, who must have a high price, and of the largest integrated companies, who can go on on the present basis, are more sharply accented.

The crux of the situation as it will come before the price conference next week is the country's ability to produce sufficient pig iron. A higher price is being urged by smaller furnace companies. On the other hand, some buyers of pig iron ask that the price be reduced, particularly on Southern iron.

A prime factor in all calculations as to steel for the second half of the year, which has not had sufficient emphasis thus far, is ability to increase the shipbuilding program.

The 30 per cent "curtailment" in passenger automobile production agreed on by manufacturers and the War Industries Board means little change in fact from the recent scale of operations due to falling demand. Only two large makers are named as likely to cut down present output. The sentiment is growing in some Washington quarters that a considerable part of the alloy steel now going to the automobile industry should be conserved for war uses. Heavy orders have gone to the mills in the last two weeks for ship material.—*Iron Age.*

4,941,276 Cars and Trucks in the United States

(*Continued from page* 538)

mont, which showed 24 per cent in 1916 and 30 per cent in 1917.

The total number of new registrations in New England showed a heavy falling off in 1917 as compared with 1916. In 1916 the increase in registrations was 86,421, whereas in 1917 the increase in registrations dropped to 58,239, a decrease of 28,182.

The record of holding the greatest number of automobile and truck registrations in relation to population is enjoyed by the agricultural states, with Iowa in the position of leadership with a ratio of one car for every eight persons in the state. Iowa has occupied this position of leadership for several years. In the calendar year of 1915 it had one automobile for every sixteen persons. In 1916 this ratio of cars was increased to one car for every thirteen. In the 1917 year a new record was placed at one for every eight.

Iowa has not much margin of leadership in this registration ratio, and again one of the great agricultural states is a close contender, Nebraska having one automobile for every nine of population. Nebraska has made rapid gains in the last three years. In 1915 the ratio was one car to every twenty-one persons. In 1916 it was cut to thirteen persons, and for 1917 it was placed at nine.

Iowa and Nebraska have a good lead on the other states, and following them are other agricultural states, with South Dakota one machine for every eleven, which figure is shared with Montana. Then come Kansas, North Dakota, Minnesota and California all on even terms, with a car for every twelve of population.

Indiana, Ohio, Wisconsin and Oregon, all grain states, have a ratio of one automobile to every sixteen persons. In the western mining states, where population is sparse and distances great, there is a high ratio of cars to population. Nevada has a one-to-sixteen ratio. Wyoming has one to fifteen. Montana has one to eleven. Idaho has one to eighteen. Arizona has one to thirteen, and Colorado has one to fifteen.

The ratio of automobiles to population in the South is relatively high, notwithstanding the big percentage increases made in all of the Southern States in 1917, as compared with 1916. Florida, although showing a percentage increase of 174, has a ratio of twenty-three to one. North Carolina has sixty-four to one. Georgia has forty-one to one. It will be some time before the ratio in the South approaches the figures of the agricultural states in the Mississippi Valley.

The car population ratio in New England generally ranges at twenty-four to one, with the single exception of Connecticut, which has the record for the group, with a ratio of one car for every seventeen population.

Reorganize Directorate of National Carbon Co.

CLEVELAND, March 12—The board of directors of the National Carbon Co. has been reorganized by election of directors so as to represent Union Carbide interests. The new directors are: M. J. Carney, W. J. Knapp and G. Ricks, and will fill the vacancies created by the resignation of J. S. Bartlett, Boston; M. J. Degnon, New York; W. Cameron Forbes, Boston; J. L. Severance, Cleveland; W. P. Schmuck and F. C. Walsott, New York. Officers of the National Carbon Co. were re-elected for the Union Carbide.

The Union Carbide & Carbon Co. was formed in October, 1917, as a holding company in the merger of the Presto-Lite Co., the National Carbon Co., the Union Carbide Co. and the Linde Air Products Co. Since that time the Air Reduction Co., the Electro-Metallurgical Co., the Michigan Northern Power Co., the Union Carbide of Canada, Ltd., the Electric Furnace Products Co., Ltd., and the Oxweld-Acetylene Co. have been consolidated.

—

Signal Corps Conducts Cadillac School

DETROIT, March 11—The technical and repair school operated at the service station of the Cadillac Motor Car Co. has now been taken over by the Signal Corps and is being operated as a mechanical aeronautical school. Most of the students come from the government ground school at Kelly Field, San Antonio, Tex. Every 30 days a group of 20 enlisted men is sent to Detroit from Kelly Field. The course covers 30 days and each day there are 2 hours of lectures and 6 hours of practical shop work.

—

23,229 Trucks Made in Detroit

DETROIT, March 11—Detroit plants produced 23,229 trucks in 1917 at an approximate market value of $45,462,000. The total production of Detroit and Flint, Lansing and Alma aggregated an approximate market value of $60,962,000.

—

Motor Parcels Post Route in Texas

TYLER, TEXAS, March 4—The second motor parcels post route to be established by the Post Office Department will be between Tyler and Dallas, a distance of 110 miles. The motor truck that will be used will also carry mail. The road between this city and Dallas was inspected and approved by government officials before sanction for the motor route was given. About nine hours will be required for the trip each way.

—

Heads Non-Ferrous Department

WASHINGTON, March 9—The Non-Ferrous Department of the raw materials division of the War Industries Board has been placed in charge of Pope Yeatman, succeeding Eugene Meyer, Jr. Meyer remains a member of the raw materials division, but at present is engaged in special work for the Secretary of War. Yeatman was formerly a consulting engineer of New York.

—

Canada Tractor Demonstration Next Fall

MONTREAL, March 9—The extensive farm tractor demonstration for eastern Canada has been scheduled to take place here Sept. 17, 18 and 19. It is expected that the recent removal of import duties from tractors will increase the number of foreign exhibits.

—

Motor Freight Line in Utah

SALT LAKE CITY, UTAH, March 9—Operation of a motor freight service between this city and Ogden will be started at once by the Motor Freight Service Co., Salt Lake City. The state highway will be used, and the rates charged will be the same as those of the railroad.

War Service Committee Appointed by N. A. D. A.

ST. LOUIS, March 11—A War Service Committee for the National Automobile Dealers' Association has been appointed by President Fred W. A. Vesper. It will co-operate with the Government's Commercial Economy Board in harmonizing the activities of the government with those of the dealers of the United States.

Various plans are in prospect. The members of the committee are:

F. W. A. Vesper, chairman.
Earl C. Anthony, Los Angeles Motor Car Dealers' Association, Los Angeles.
Charles Collier, Brown County Auto Trades Ass'n, Green Bay, Wis.
A. E. Mitzell, Ohio Auto Trades Ass'n, Canton, Ohio.
A. E. Maltby, Philadelphia Auto Trades Ass'n, Philadelphia, Pa.
F. E. Murphy, Minneapolis Auto Trades Ass'n, Minneapolis, Minn.
George W. Browne, Milwaukee Auto Dealers' Ass'n, Milwaukee, Wis.
Dayton Keith, Chicago Auto Trades Ass'n, Chicago, Ill.
J. H. McAlman, Boston Auto Trades Ass'n, Boston, Mass.
George D. McCutcheon, Atlanta Auto Trades Ass'n, Atlanta, Ga.
O. P. Tyler, Worcester Auto Trades Ass'n, Worcester, Mass.
Fred J. Caley, Cleveland Auto Trades Ass'n, Cleveland, Ohio.
Charles W. Browne, New York Dealers' Ass'n, New York City.
Finley L. MacFarland, Rocky Mountain Automobile Ass'n, Denver, Col.

—

Couzens No Longer Police Commissioner

DETROIT, March 9—James Couzens, police commissioner here, and formerly vice-president of the Ford Motor Co., was dismissed last week by Acting Mayor Walsh during the absence of Mayor Marx. The council demanded his dismissal 2 weeks ago, but the Mayor refused.

Calendar

Your Car

YOUR car may have an engine that climbs the steepest hill without a flinch; it may have a body beautiful as a picture, but if it lacks comfort there is no joy in it for you.

And your car will lack comfort unless it is upholstered with Wilson's Curled Hair.

No other material will give you anywhere near the same comfort, durability and all 'round satisfaction, because it is the only material that meets to the exact nicety every requirement of automobile upholstery.

THE process used in its manufacture firmly imbeds the curled hair into a fabric base, which prevents shifting, bunchiness and matting down, yet does not impair the resilience in the slightest degree.

Many automobile manufacturers are sending us blue-prints of their seats and backs, and are having Wilson's Woven Curled Hair cut to fit exactly. We also make a specialty of cutting plaits, or pipe-fillers.

Write us today, stating your requirements, or send blue prints, and we will furnish you with samples and prices.

The Height of Lens Development

THE Dillon Multi-Vision Lens marks a new era in lens performance. Not only is it a radical departure in design, but it is evolutionary in results.

The central bull's-eye, for instance, is an exclusive advantage of the Dillon. This bull's-eye has an important function—that of concentrating and magnifying the light on the road. This light is made glareless by the light from a carefully determined proportion of clear glass above the bull's-eye. The clear glass at the bottom provides the necessary front and side lighting.

The Dillon is the only lens made that gives you TWICE the lighted area, by projecting a SQUARE path of light. It is also the only lens made that projects entirely beyond the rim.

In no respect is the Dillon excelled and any of its chief features alone make it supreme in its field.

Write for literature, or send cash, check or money order, together with make and model of your car if you cannot obtain Dillon Lenses.

SERVICE We Keep Sioux Tools Always Sharp--No Charge

Keen cutting edges and accurate angles are absolutely necessary in valve reseating tools. A variation of a hair's breadth in the angle of a valve seat reamer would make it impossible to seat a valve perfectly.

Sioux
Valve Seat Reamers

are not only accurately ground before they leave the factory, but we keep them in perfect condition free of charge—the owner paying only the transportation charges. This insures satisfactory results at all times.

The Sioux Refacing Tool

is also delicately adjusted. Great care must be used to keep the angle exact, when sharpening. Our expert service cares for any Sioux tool that may require sharpening.

Sioux tools are superior in working principle, material and workmanship. Each one a time and labor-saver. The livest jobber in your town is the man for you to see—today.

CASE SIX

Seven-Passenger Family Model

Only Proven Features

Those Recognized as Best

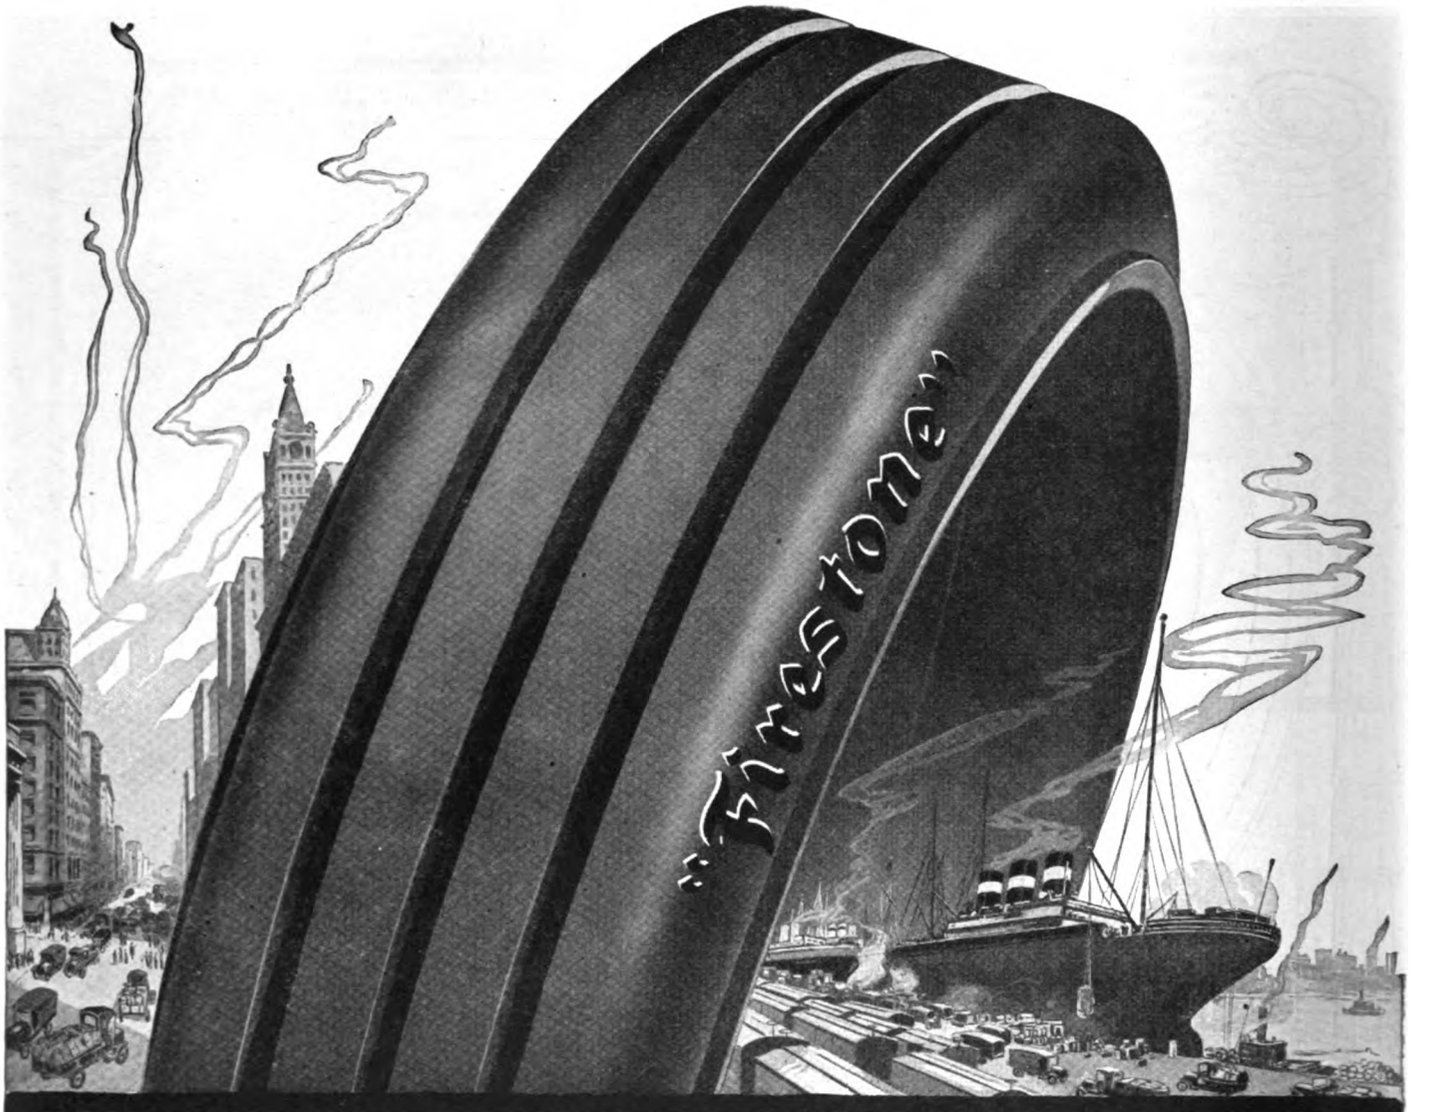
IN the New Case Six, the "All-Feature Car," one finds only famous, tested parts. It is stripped of every experiment, every useless attachment. There is nothing freakish.

Men insist on this sort of a car nowadays. Men want a proven engine like the Case-Continental. Men know and appreciate Westinghouse Electrical Equipment, a Borg & Beck Clutch, Grant Lees Transmission, Columbia Axles, Jacox Steering Gear.

Such well known features as these stand for stability and performance. Men can count on them.

People want handsome cars, too. No car on the road is more beautiful than the New Case Six. It is the beauty of simplicity, such as conservative, knowing people always choose.

All men insist on economy both in upkeep and operation. The New Case combines all the proven principles of construction.



A car with all the Case superiorities would have to be built in exactly the same manner as the New Case Six. To depart from these standards is to leave the field of admitted successes.

No man can afford to buy a car without becoming acquainted with the New Case Six. In this one car we know you will find all the features which have attracted you in different cars, but were never combined before.

Family Model for 7 or 5 people, color dark blue, $1875; All-Seasons Model, Springfield Type, for 7 or 5 people, color dark blue, $2375; Sport Model for 4 people, color periscope green, $1075.

A Transportation "Giant"

THE full value of the motor truck is now being universally felt. From bridging the gaps of transportation due to unusual demands on railroads, it has established itself as an organized system of distribution, running from city to city on definite schedule. Since the builders of

Firestone Tires

originated this Giant truck tire, three years ago, there have been practically no restrictions to motor transportation. Equipped with these massive tires, *with the grooved treads,* trucks get through snow, mud and over ice, connecting the commercial centers with the outside world, independent of track or congested thoroughfare.

These Firestone Giant truck tires make tremendous loads possible because all the rubber is under all the load all the time, regardless of irregularities in the road. This great bulk of resilient rubber in one body, grooved to give play and grip, accounts for the remarkable traction of this tire, the fuel it saves, the unusual protection it affords the truck, and the net result of Most Miles per Dollar.

Sizes: 8, 10, 12 and 14 inch widths for medium and heavy duty. There are many other types of Firestone Truck Tires, one for every load, road and condition. Consult the Firestone man.

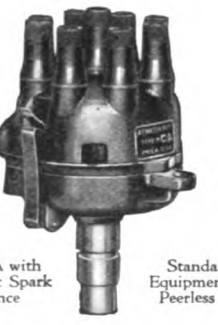
ATWATER KENT
SCIENTIFIC IGNITION

And the PEERLESS Two-Power Range Eight

FROM the slowest motor speeds to maximum, Atwater Kent Scientific Ignition supplies a big, hot, dynamic spark. For this reason, the Peerless Eight and thirty other manufacturers of first-class cars, trucks, motors and tractors have adopted it as standard equipment.

There is a steadily growing business for aggressive dealers in the replacement of magnetos with Atwater Kent Scientific Ignition.

Be the Atwater Kent dealer in your locality



The "Loafing" Range

TO PURR along in the consciousness of tremendous reserve force—

To be able to loaf smoothly behind retarded traffic and yet be able to dash ahead the instant there is an opening—smoothly — without hesitation—and quickly reach any permissible city speed.

That is the charm of the Peerless Eight in its "loafing" range.

To have in reserve rugged resistless power *at no expense until you use it*—that is the economy of the Two Power-Range Peerless Eight

Type CA with Automatic Spark Advance

Standard Equipment on Peerless "8"

The "Sporting" Range

TO TAKE a new lease on life and climb on with renewed courage when you would expect her to falter at so long and steep a grade—

To speed faster and yet faster after you thought she had delivered her final spurt—

That is thoroughbred performance — the kind that the "sporting" range of power makes possible in the Peerless Two - Power - Range Eight.

When you call upon the Peerless for feats of prowess of which few cars are capable you get instant, willing, able response

THE new Brake Inspection Movement has obtained the unqualified endorsement of motorists all over the country. Police Commissioners, Presidents of automobile clubs and other prominent officials and motorists have assisted in giving the movement the most widespread publicity.

The car owners in your vicinity are interested in this new movement for the periodical inspection of brakes on motor vehicles, because it means greater safety to themselves and to their cars. This interest can be turned into profit for you. Tie up your business with this movement. It offers a wonderful opportunity for you to obtain general overhauling jobs before the touring season opens. Don't let a motorist go past your window without reminding him of it, at least by a sign.

Scientific tests prove Thermoid superiority

When your customers come in for brake lining give them the best. Thermoid Brake Lining is superior to any other brake lining on the market for three reasons.

More material, greater service

1. There is 40% more material and 60% more labor used in the manufacture of Thermoid Hydraulic Compressed Brake Lining than in any woven brake lining. This abundance of material and labor means longer wear.

Grapnalized

2. Thermoid Hydraulic Compressed Brake Lining is Grapnalized, an exclusive process which resists moisture, oil and gasoline. Moisture causes brake lining to swell, making it grab or slip.

Hydraulic compressed, uniform throughout

3. Every square inch of Thermoid is hydraulic compressed at a pressure of 2000 pounds. Thermoid is uniform all the way through. It cannot compress in service. There are no soft spots to wear out quickly. It will give uniform service until worn cardboard-thin.

Endorsed by automobile manufacturers

The engineers of fifty-one leading car manufacturers, ten of the most prominent axle-makers, all leading jobbers and thousands of dealers have selected Thermoid Brake Lining because of its dependability.

We are co-operating with jobbers and dealers to make this season the biggest ever, not only in Thermoid Brake Lining but in all branches of their business.

Advertising campaign in your city

Our new book, "The Brake Inspection Movement and What it Means to Dealers" tells in detail how we have planned to advertise your store direct to the car owners of your city, over your name. It is jammed with interesting and profitable ideas for increasing your business.

If you have not received your copy of this book write for it today.

Our guarantee: Thermoid will make good or—WE WILL.

$\frac{V^2}{10.8}$ **Will your car do this?**

Automobile engineers have proved that when brake mechanism is right and road conditions average, any car should stop at distances and speeds given by the chart.

V^2 means the square of the velocity or speed of your car. 10.8 is the proved factor of retardation under average road conditions. This factor decreases on smooth, slippery roads to 6.7 and increases as high as 17.4 on rough, worn roads. The chart represents the average condition, and other conditions can readily be figured by changing the factor within the given limits.

Remember that your brake mechanism is not "right" unless its brake lining has the ideal co-efficient of friction. The better the brake lining the quicker your stop.

Thermoid Brake Inspection Chart

The Peerless Dealer's Big Advantage

PEERLESS

Two-Power-Range Eight

Ready to Romp

An effortless, light-hearted frolic!

That's what the Peerless Eight makes of the ordinary day's work of utility driving.

The soft, easy flow of eighty-horsepower makes it a romp.

Would you crawl at a snail's pace behind retarded traffic? You may do so with utter smoothness.

Does the traffic open up? The advantage is yours for you have the "pick-up" to leave the cars about you as though they were stalled.

And the limit of speed for the open streets is a romp for your eighty horsepower.

And you waste not at all.

For all this is done in your "loafing" range of power—on half rations.

Many a lesser powered six—even many a four—would starve on the fuel that carries your Peerless romping through the day's work.

"Loafing" Range

ECONOMY

Ready to Race

But not every day is a work day.

With your Peerless you sacrifice none of the holiday joys—you are equally as ready to race as to romp—you have your "sporting" range.

You may master the road whatever the adverse conditions; you may make Time laugh at Distance.

You have only to open your throttle wider to release her double poppets and utterly change the character of her performance.

Gone now the soft flow of eighty horsepower "loafing"—as you reach her "sporting" range there comes a deep growl of brute power, all conquering.

In her "sporting" range she is as mighty as she was gentle in her "loafing" range.

The Peerless dealer has a big advantage because he can demonstrate the joy of these startling contrasts in performance—and the practical economy gained without sacrifice.

"Sporting" Range

POWER

Seven Passenger Touring

$2340

Roadster $2340

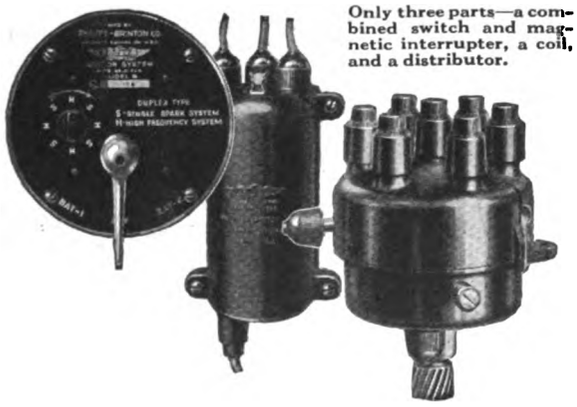
"—and that stream of a thousand sparks a second keeps the plugs as clean as a whistle."

FOUL plugs hinder satisfactory ignition—no doubt about that. But even the best motor will develop some carbon, and carbon attacks the spark plugs first.

The Philbrin High Frequency Ignition System burns the carbon from your plugs and keeps the electrodes as clean as new. Instead of removing the plugs and cleaning each separately, you merely turn the Philbrin switch to "H" (High Frequency) and the resulting stream of hot, intense sparks does the rest, without the least injury to the spark plugs.

That is but one of the many advantages of this system. It is equally effective in overcoming poor fuel, a bad mixture or carbonization resulting from inferior oil and leaky piston rings.

The Philbrin Single Spark System, on the other hand, operates to minimize carbon deposit, first by making it possible to utilize a much leaner mixture and, second, by exploding every charge of gas that enters the cylinders more completely.



The result is greater economy and more power, because it is a well-known fact that a lean mixture though more difficult to ignite is more powerful when fired.

The efficiency of Philbrin Single Spark Ignition is due in large part to the patented Contact Maker and Condenser which provide for thorough saturation of the coil, followed by an instantaneous break—assuring a full-bodied spark of great intensity that fires the mixture instantly.

Together these two systems of ignition offer the assurance of greater gasoline mileage; increased and more flexible power, and an "antidote" for every emergency that threatens effective ignition. Obviously the dependability of two complete and different systems of motor ignition is greater than any single system alone could offer, particularly since each system individually has been developed to the highest point of efficiency.

Made in models for all cars with special mountings for magneto replacement when required. Write for catalogue.

Our proposition to jobbers and dealers is unusually attractive. Write at once for unassigned territories.

Only three parts—a combined switch and magnetic interrupter, a coil, and a distributor.

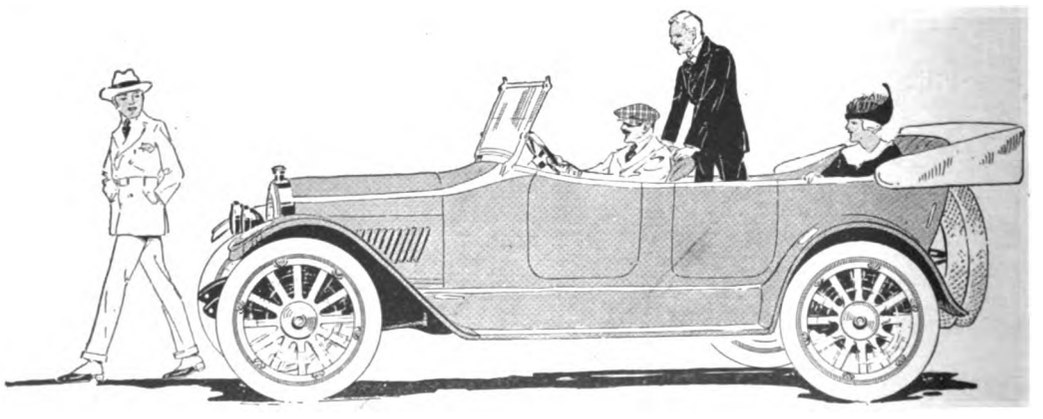
Compare the Oldsmobile and what it does

with other cars of like price, or even more. And the more carefully, the more closely you analyze, the more firmly will this great car establish itself in your confidence.



A demonstration of its power capabilities will convince you of its claim to distinction as the real performer in its price class—and *the* light weight Eight at a moderate price.

Take it out on the highway and watch the ease with which it accelerates on the meanest hills, watch its remarkable speed on the straight-away, watch its staunch, faithful going over roughest roads in sand, mud or snow.

Take it into congested traffic. Note the ease with which it throttles down to a walking pace. Step out of the car and stroll beside it. Then note the lightning get-away at the traffic signal.

With a car of this character is it any wonder it is represented by the livest and best selected dealer organization in the country? There are still some open memberships. Write or wire for the details.

How Much Can You Trade It In For?

The test of automobile value is the price you can get for a used car; and that price is increased or decreased according to the condition of the engine, bearings, gears, and other moving parts.

Are you protecting those parts?

Figure how the yearly cost of the machine's operation, repairs or depreciation may vary.

Compare it with the slight yearly cost of scientific lubrication. Scientific lubrication does more than protect the service of your car; it protects the price you get when you trade it in.

The next time you buy oil or grease for your motor car, remember the actual saving you will make by insisting on scientific lubricants.

Automobile owners, manufacturers, machinery owners: this is the time of all times to consider operating costs and how they might be reduced by scientific lubrication.

Permit us the opportunity of offering the benefits of our 65 years' experience. Write for details.

Booklets on
Scientific Lubricants for Scientific Lubrication
on request

SPECIALTIES

Automobile Division

These products can be obtained from most good dealers and garages. Send direct for complete information, mentioning your dealer's name.

☐ **GEARESE**—A correct lubricant for motor car transmissions and differentials.

It follows the gears continuously, leaving no spot where metal can touch metal. Gearese insures against wear, reduces friction and insures a silent, smooth-running car. Gearese maintains its lubricating consistency under all temperatures—does not cake on the walls in coldest weather, nor break down and run out, under heat.

Gearese should be packed into your gear case and differential about once a year.

☐ **CUPESE**—A special quality cup grease, produced by the exclusive Acaloric Process. It is made in all densities, from very light to extra heavy. Its uniform functioning under all conditions, makes it ideal for wheel bearings, brake connections, gear and clutch levers, universals, spring leaves and bolts, steering arms and knuckles and axle caps.

Cupese spreads rapidly, adheres to the bearing surfaces, is tenuous and elastic, absolutely prevents metal-to-metal contact. It does not liquefy or evaporate under intense heat—does not cake at low temperature—does not clog bearings or leave residue in cups. It is all lubricant.

☐ **MOTUL**—A superior quality oil for the protection of automobile motors. Motul is made by a special process which insures super heat-resisting qualities. Although the heat of explosion in the cylinders is terrific, Motul maintains its lubricating consistency—keeps friction under control—protects your motor, bearings and cylinders. Under test Motul shows a minimum of carbon residue.

☐ Check here for descriptive literature.

For Foundries

☐ **CORUL**—A special quality liquid core binder that meets the eleven essentials of uniform and economical core making for malleable and gray iron casting.

☐ Check here for descriptive literature.

SPECIALTIES

For General Machine Use

☐ **SLO-FLO**—A super-lubricant, made by the Acaloric Process. Does not climb, drip or spatter. It is adhesive and cohesive—heat and pressure resisting—non-volatile. It is extensively used:

—particularly for delicate, fast-running machinery in textile and other mills, in printing shops, etc., where neither a fluid oil nor a dense grease is practicable. Slo-Flo stays "put," yet lubricates instantly and constantly.

—for roller bearings in mine cars, automobiles, etc.—for hydraulic pumps, line shafting, lighting dynamos in railway cars.

—in railway and machine shops, in industrial and power plants where excessive heat and bearing pressures must be overcome and where oil is impracticable or grease impossible.

☐ Check here for descriptive literature.

Miscellaneous

☐ **TEXTUL**—A special oil compound which has all the good qualities of Red or Lard Oils—yet offered at far less cost. Textul saponifies readily—carries well through the carding process and needs no alkali added for emulsion.

☐ **ASBESTESE**—A special asbestos and wool-mixed grease combination for steam, electric and logging railways, traction lines, contractors'- and mine-car journal lubrication, etc.

☐ **AERUL**—A practical quality oil for aeroplane motors.

☐ **MARINUL**—A world-known special oil, produced to meet the excessive stresses of marine service.

☐ **TALESE**—Die-swabbing requires a product which will perform an absolute separation of the metals, have a low flash tendency and function with a minimum of smoke. These requirements are met by Talese at surprisingly small cost.

☐ **EXESE**—The 600° F. lubricant for oven gears, bloom cars or lubrication under excessive heat conditions anywhere.

☐ **VESUVESE**—A waterproof lubricant, for exposed gears—for wire cable dressing.

☐ **LARCUL**—A practical, economical metal-cutting lubricant.

Also—☐ Atlas Cutting Oils, ☐ Atlas Tempering and Quenching Oils, ☐ Atlas Leather Oils and Greases, ☐ Atlas Fish Oils, ☐ Atlas Spindle and Loom Oils, ☐ Atlas Wool Oils.

Automobile and hardware accessory jobbers and dealers are offered unusual co-operative opportunity with a quality line. Write for details.

MARVELITE
Alight at Night

Marvelite applied to dials of any description makes them easily readable in the dark—the darker it is the better. No lights required.

Marvelited Dials

are the kind to use on autos and aeroplanes and on gauges and other instruments, because—

1st. MARVELITE is made with real radium.
2nd. It is permanent for all practical purposes.
3rd. It has been selected by the United States authorities, meeting the strict Government requirements.
4th. Prominent manufacturers have also selected it from the field because of its demonstrated qualities.
5th. MARVELITE is not dependent upon exposure to artificial light for its luminosity. Such phosphorescent products are short lived and unsatisfactory.
6th. The completeness of our organization, together with our large reserve supply of MARVELITE, enable us to guarantee prompt deliveries.

Manufacturers—Send us a dial and hands to be treated, without charge, with MARVELITE. It will prove itself. MARVELITE can be applied by you or by us. Estimates submitted.

Ask for Booklet No. 2—Valuable information about luminous compounds.

Service Stations in All Principal Motoring Centers

Automobile Builders are using the
KANT-KLOG
Primer as standard equipment, because of its remarkable efficiency and low price.
It solves the problem of cold weather starting and can't clog with carbon.
Kant Klog simplicity is seen in the section. No part of valve is exposed.
There is clearance for free flow of gasoline without waste when priming.
There is no chance of carbon getting past and collecting on the seat. The more it is used the better its seating action.
We will quote on Kant Klogs for every type of motor. Our prices are low. Write for particulars and free sample.

Hartford UNIVERSAL Joints

Established 1906

The
Hartford Automobile Parts Co.
Hartford, Conn.

We are able to offer manufacturers universal joints manufactured by specialists in one of the largest plants in the world.

The wearing surfaces of HARTFORD UNIVERSAL JOINTS are hardened and ground, the grinding being accomplished by a specially devised machine whose use eliminates depressions or elevations so common in steel parts that have been simply reamed.

The reputation of your car demands the best universal joints that can be made, and we have them.

AGATHON Alloy STEELS

AGATHON—the idea—has been revived in all its Hellenic splendor as it lives today in AGATHON Alloy Steels.

Their superlative excellence is but a reflection of the glorious achievements which have kept the fires of ancient Grecian culture burning throughout the ages.

AGATHON Alloys Will Serve Your Purpose Best

The black lines show the ordinary tire compared with a McNaull of the same size.

More Air—More Wear
More Sidewall Strength

A BIGGER, wider, thicker tread—

A steel flange for sidewall—where ordinary tires "blow."

A bigger chamber for air.

More wear in the tread—more strength in the sidewall—more air to ride on—

But very little more material—we simply put it where it will serve.

That's why McNaull's cost very little more to **buy**—and so much less to **use.**

There are many more advantages.

The McNaull Tire Company, Toledo, Ohio

Ten cents a copy
Three dollars a year

A Shortage of Automobiles!

Wise Dealers Are Taking Every Car They Can Get. Those Who Delay Now Will Face A Serious Situation When The Active Selling Season Opens.

Daily developments serve to confirm our earlier prediction that this year will witness an automobile shortage more acute than any the industry has experienced within the last several years.

From the present indications it seems certain that by July 1st all stocks of the most popular cars will have been exhausted, and that from that date on dealers and buyers will have to depend upon limited productions to meet their wants.

Because of war conditions a curtailment was made in the production schedules of every manufacturer in the industry. No maker had planned to produce as many cars this year as were built last year. But now even those greatly-reduced schedules have been so interrupted by one influence or another that it will be impossible to make up what has been lost.

The most serious condition from which there seems to be no escape is that resulting from freight embargoes. Dealers who do not have cars coming to them every day can hardly realize the seriousness of the situation which exists throughout the industry. Embargoes are placed on shipments without notice and for indefinite periods. A dealer may feel that if he gives his factory instructions to ship him cars on some future definite date that his wants will be taken care of. But before the date of shipment, an embargo may make it impossible.

This will inevitably produce a serious situation for those dealers who rely upon their being able to obtain cars from the distributor when and as they may want them. It will prove of particular disadvantage to those dealers who postpone making contract arrangements.

Hudson Dealers are going to need cars. The billions of dollars that are finding their way into circulation are going to look for automobiles.

No Hudson Dealer need have any worry about over-stocking this spring.

The New Improved UTILITY Universal Rim Wrench

Is the Most Serviceable Tool for Motor Car Use

Belongs In the Tool Box of Every Motor Car

Price $1.50

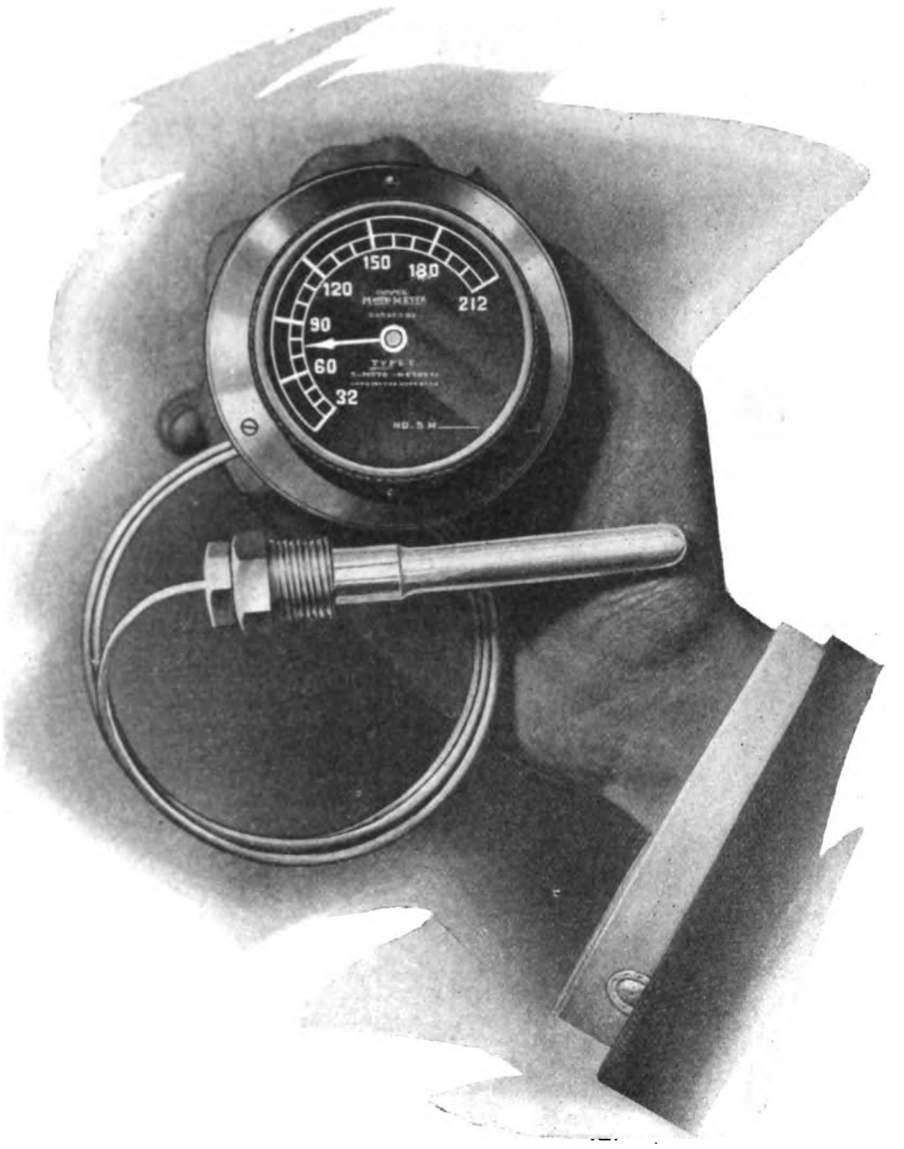
Indispensable In the Service of Every Going Garage or Repair Shop

One Tool Fits Every Nut

The UTILITY Universal Rim Wrench is built in only one size—yet it **automatically** fits every nut on every demountable rim. In the tool box of the motorist, in the stock or the shop of the garage or repairman, it is small enough to be always out of the way—except when you need it. Then it is always ready for use—a single tool that fits, holds, and turns any nut.

The new UTILITY Universal Rim Wrench is beautifully finished in nickel and black enamel. It is more compact and lighter, and built with practically unbreakable jaws. It is shortened to go into the tool box without folding, and is absolutely rigid in action—a stronger brace that cannot close up or slip while in use by the operator.

HILL PUMP VALVE COMPANY, Archer Ave. and Canal St., Chicago



Eastern Sales Office: 149 Church St., N. Y. C.
Western Sales Office: 149 Montgomery St., San Francisco, Cal.

Mfgrs. of Famous UTILITY Protected Heaters for all Motor Cars.

Ask your dealer for it now.

DEALERS, order from your jobber. One of these tools used in your own shop will be a money-maker for you. Sells on sight to car owners.

BOYCE MOTO METER

DISTANCE TYPE

For aeroplanes, tractors, stationary engines and motor boats.

BETTER BECAUSE—

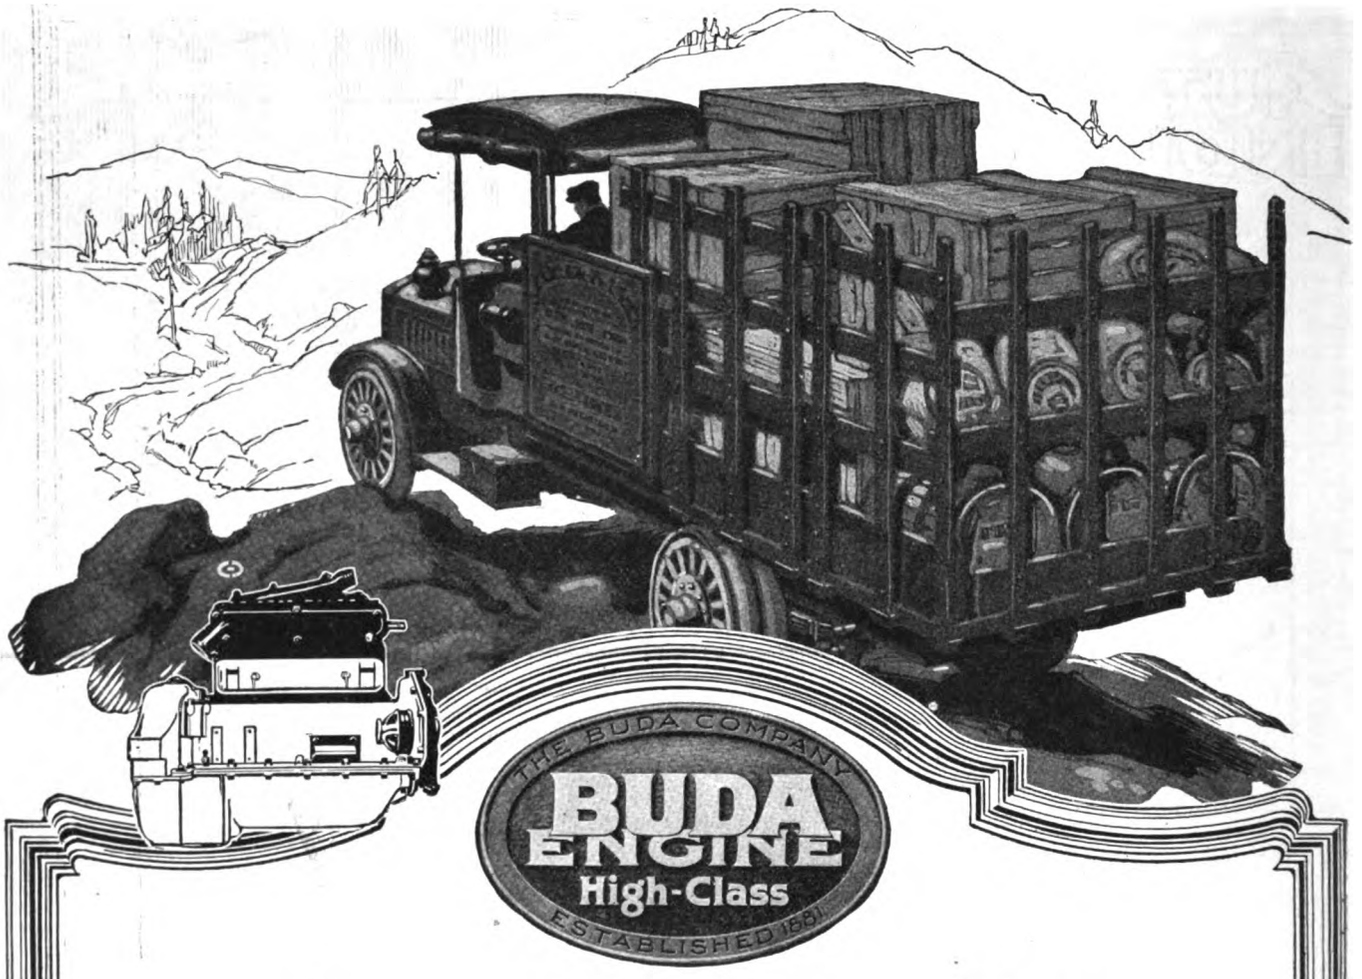
FIRST, it registers the full scale of 32° to 212°. This is important. (Others from 100° to 212° only.)

SECOND, no gears, direct movement of the pointer. (All others built with an unreliable 15 to 1 gear movement.)

THIRD, smooth, unbroken, non-vibrating movement of the hand. (Others are unreadable under vibrations.)

FOURTH, remains accurate up to 25,000 feet altitude. (Others read 5 to 19 degrees *inaccurate*.)

FIFTH, weight with 12 feet of tubing only 12 ounces.



There Is Only One Reliable Motor Heat Indicator. The Name "Boyce" Is Your Guarantee

May we ask you to compare this instrument with others before ordering your requirements? Don't pay more for a less reliable instrument.

Smooth in Action, But a Brute for Work

That just about sums up the impression made by the BUDA ENGINE on one as familiar with it as its driver, whether in truck or farm tractor.

Except for its sturdy appearance, it would seem impossible that a machine which runs so smoothly could be so powerful or so enduring in severest use as the BUDA ENGINE.

The secret is in the careful BUDA manufacturing process, always putting "Performance before Price."

The New Way to Mend Radiators

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, motor head gaskets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks in just a few minutes without laying up the car. No mechanical experience is required—all you have to do is remove the cap and pour the cement into the radiator.

JOHNSON'S RADIATOR CEMENT

Quick—Efficient—Harmless

Johnson's Radiator Cement contains no powders, cement or anything which can coat or clog the cooling system and is absolutely harmless in every respect. It will ordinarily seal a leak from two to ten minutes.

Johnson's Radiator Cement blends perfectly with the water until it reaches the leak—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water making a permanent seal.

Quarts, $1.75 Pints, $1.00

U. S. A. Motorcycle Engine Completed

Of Two-Cylinder, Vee, Air-Cooled Type and Capable of Developing 15 B. Hp.—Moderate Compression Used to Enable It to Run Smoothly Under Load at Low Speeds

By P. M. Heldt*

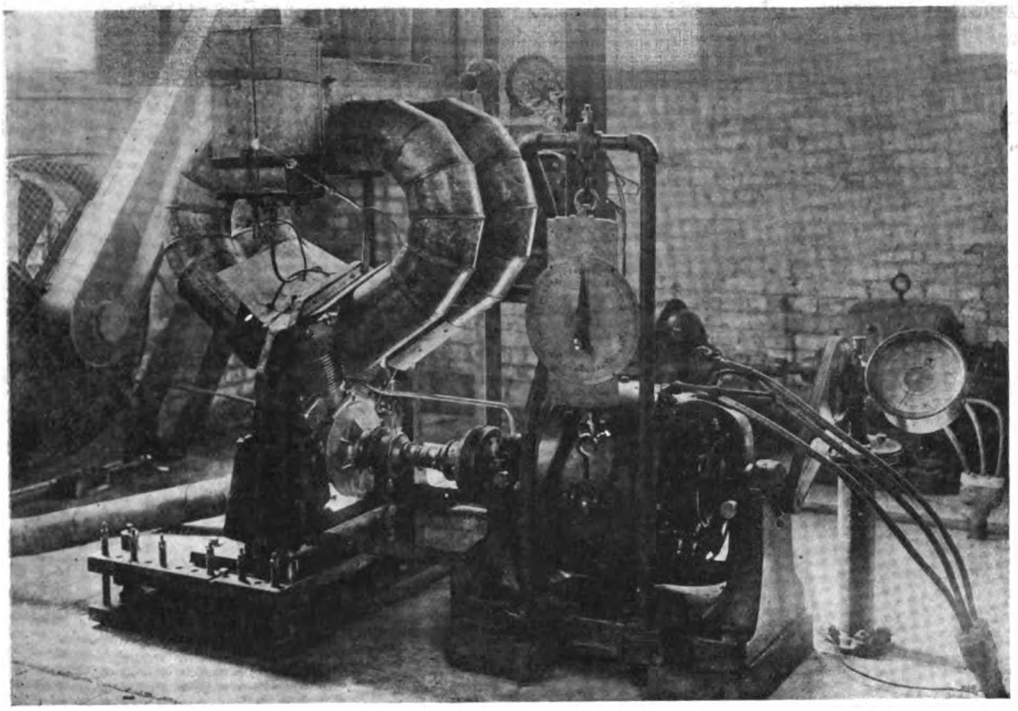
WORK has about been completed on the new engine with which are to be fitted all motorcycles to be purchased by the Quartermaster General's Department from a certain date in the not distant future.

Like the three special truck models designed for the department, the motorcycle will bear the name of the U. S. A. and will be used for a wide range of duties at and behind the front. Probably 90 per cent of all the machines required will be fitted with side cars, and in view of this and the heaviness of the roads to be traveled, the engine will be built with slightly lower compression than present-day standard motorcycle engines. This will somewhat depress the power curve at the upper end, but will enable the engine to run on full throttle at a lower speed; in other words, it will cause the machine to "hang on" with great tenacity in pulling through sand and mud or under other difficult conditions.

There is nothing radically new in the design of the engine, which may be said to embody the best modern practice in motorcycle engines. Where deviations from stock practice have been made the reason has been either that the special purpose for which the machine is designed could be better met by a different design, or, since no commercial questions need be considered, and the best is just good enough for Uncle Sam's boys at the front, materials are used which would not be considered in stock practice because the average purchaser would not appreciate their value.

The U. S. A. cycle engine is of the 4-cycle, two cylinder, Vee type, air cooled. It has a bore of 3 5/16 in. and a stroke of 3½ in., giving a piston displacement of 60.34 cu. in. The compression space is such as to hold 6⅜ ounces of water, and as one ounce of water is equal to 1.728 cu. in., this figures out to 11 cu. in. As the piston displacement of each cylinder is 30.17 cu. in. this gives a compression ratio of

$$\frac{30.17 - 11}{11} = 3.74.$$



The cooling flanges on the cylinders run circumferentially, while those on the head run fore and aft. As the heads are cast integral with the cylinders, longitudinal flanges on the heads facilitate the casting of the cylinders, as compared with a construction in which the cylinder head flanges are arranged radially. The ribs on the sides of the intake valve pocket also run horizontally.

Between the axes of the two cylinders there is an angle of 45 deg., a feature of design that is largely determined by the space available in the conventional motorcycle frame. The two cylinders are secured by four studs each to the aluminum crankcase, which is made in halves, with the division in a plane at right angles to the crank axis.

On the crankcase castings are formed a bracket for the ignition magneto and a saddle for the lighting generator, the two being located on opposite sides. The

*P. M. Heldt went west and spent a week with the Board of Motorcycle Engineers while tests were being conducted to determine the characteristics of the new engine, to select the most suitable of a number of different designs of inlet manifolds, carbureters and air cleaners, and to determine the regulating qualities of a number of electric generators specially designed for this machine.—EDITOR.

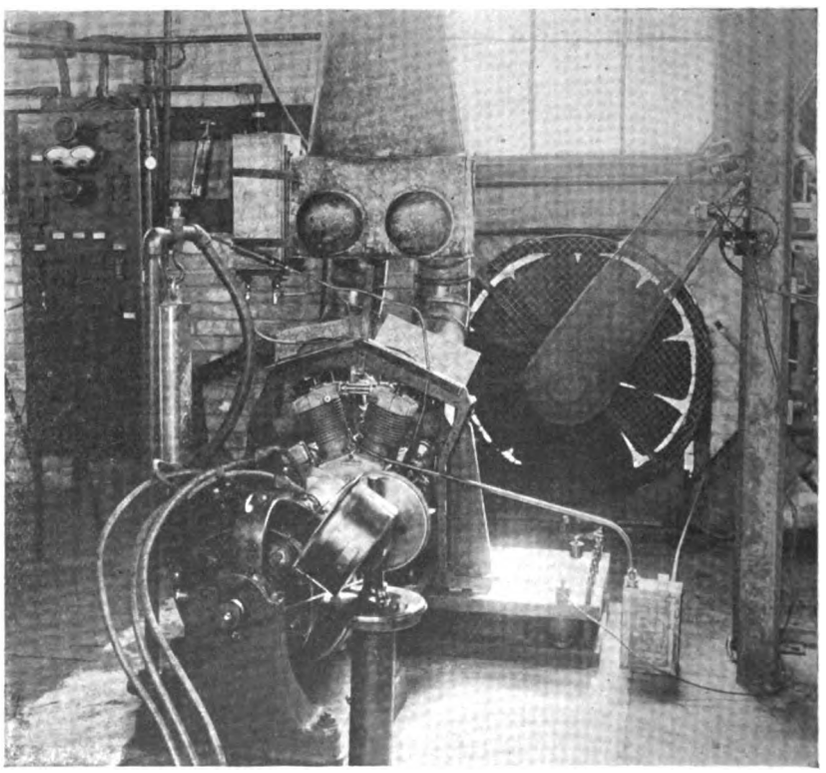
Digitized by Google

U. S. A. cycle engine on testing stand. Note arrangement for artificial air cooling

magneto is clamped down to a planed surface in accordance with standard practice, and the generator is clamped to a cylindrical seat or saddle.

This saddle is bored out and at the middle portion of its length it is relieved to receive a piece of strip steel which is secured in place by means of machine screws and has its end formed into hooks. These hooks engage slots in the clamping strips which are drawn together by a machine screw and nut at the top and thus securely hold the generator in place.

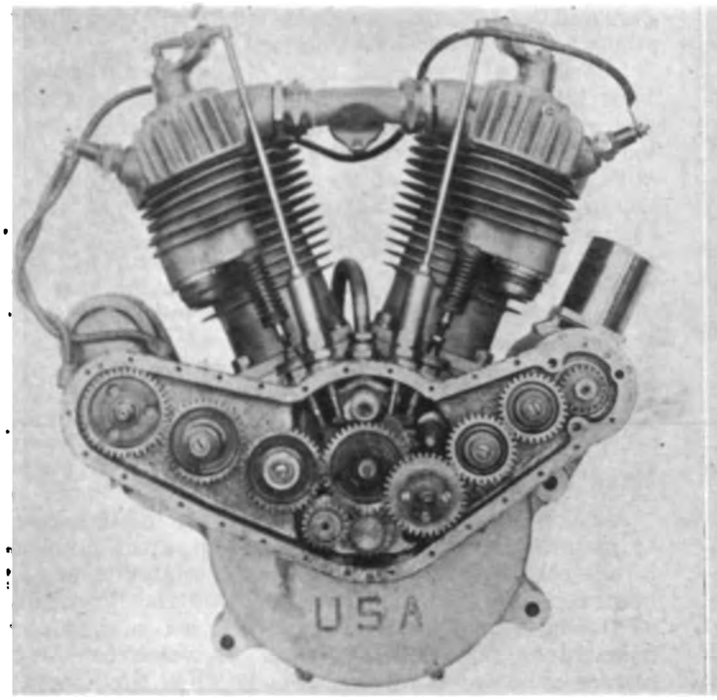
A so-called keystone type of frame is to be used in the U. S. A. motorcycle. Instead of the frame tubing looping around the crankcase at the bottom and carrying brackets to which the engine is secured, the engine crankcase forms the keystone of the frame structure. This places considerable strains on the crankcase in going over rough roads, and to allow for these some rather heavy lugs are cast on the lower part of the crankcase, and the crankcase wall between these lugs is thickened.



Roller Bearings Used

All bearings on the crankshaft, with the exception of that at the cam-gear end, are roller bearings. One of the connecting rods has its head made in the form of a yoke, and the other is of the ordinary type. Both have solid heads, which is rendered possible by the fact that the crankshaft is built up and the connecting-rod heads can be stripped over the crank-pin before the latter is assembled with the flywheels.

The joints between the journals and the flywheels are of the taper, key and nut type. The two inclosed flywheels will be made from drop forgings instead of from iron castings. Although the bursting of flywheels is an almost unknown occurrence in the motorcycle industry, it was considered good practice to make this impossible in the army machine. On the crank-pin there are four rows of rollers, two in each connecting-rod head, and on the main journal at the power take-off end there are two rows of rollers. The piston-pin bushing is bronze.



Cast-iron pistons are used, with three rings at the upper end and an oil groove at the lower end. There is a wide land between the top and intermediate ring which furnishes most of the bearing surface at the top end. A substantial rib connects the piston bosses to the head and helps in the transfer of heat from the head to the skirt. The wrist pin is secured in one of the piston bosses by a 3/16-in. solid pin with a cotter end. The connecting rods are drop forgings of I section, and are made as light as their work will permit.

An interesting feature of the engine is the all-spur gear drive for the camshaft, the magneto, and the lighting generator; with it is combined also the worm drive for the oil pump and the drive for the crankcase release valve. There are eleven spur gears in this double train, but each is of liberal dimensions for the amount of power to be transmitted, is carried on a well-supported shaft or a hardened stud supported at both ends, and provision is made for thorough lubrication, so the likelihood of trouble is very slight.

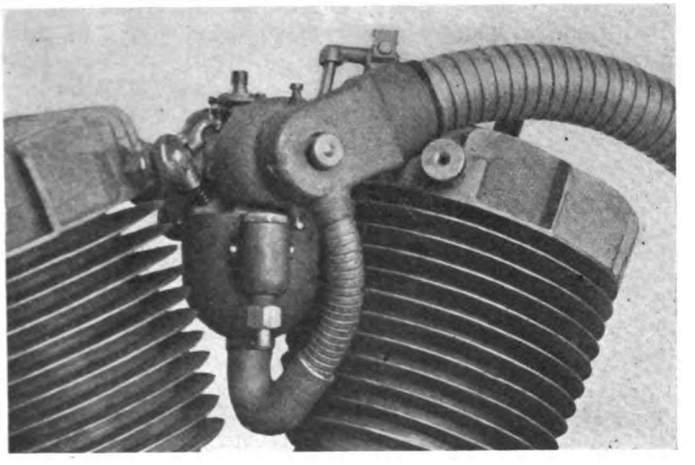
U. S. A. cycle engine with gear cover removed, showing generator and magneto drive

Driving side of U. S. A. cycle engine, showing generator and magneto mountings

Though the magneto runs only at one-half crankshaft speed, the generator runs at twice crankshaft speed, this high speed resulting in a very light and compact machine. As current for lighting is used only at night and the generator serves no other purpose than to furnish this current, provision is made for disconnecting the generator during the day.

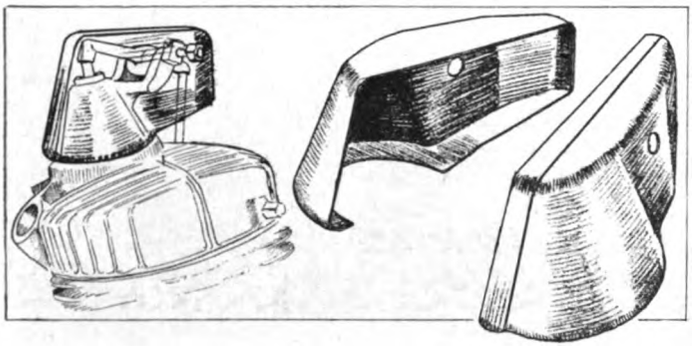
Magnets and Generator Drive



Referring to the photograph of the engine herewith, showing the gear case cover removed, the crankshaft pinion meshes with the camshaft gear directly above it. This latter meshes with a pinion to the right of it, which is hidden in the illustration by the gear in front of it. This set of gears on the same axis can be coupled together and disengaged from each other by means of a jaw clutch whose members are formed on the gears themselves and which is operated by means of a knobbed rod extending through the cover plate.

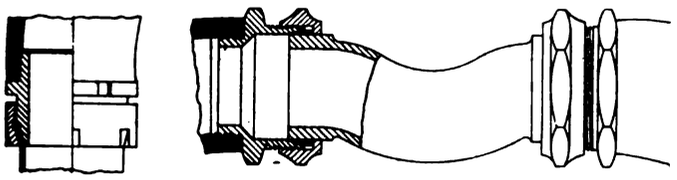
In designing the jaw clutch the engaging surfaces were given such a rake as to make it impossible for the driver to engage the clutch while the engine is running, though it can be disengaged without stopping the engine. The reason for this construction is that if the generator armature were connected to the crankshaft by a positive clutch while the engine was turning over at high speed, owing to the very considerable inertia of the armature, there would be a tremendous shock and very likely something would have to give way.

From the clutch gear, motion is transmitted through two idler gears to the generator gear and when the clutch is disengaged these four gears remain stationary. To open the clutch, the driver pulls on the knob of the clutch rod or pin. There are two circular grooves on this rod, into which the nose of a spring-pressed locking dog in the cover plate engages, one groove corresponding to the "in" position and the other to the "out" position of the clutch. All gears are case-hardened and run on hardened studs.



In the photograph showing the gear cover removed from the engine may be seen the method for insuring an accurate mesh of the generator gear with its driving gear. The forward end plate of the generator is turned with a shoulder 1⅝ in. in diameter and 5/16 in. long, which enters a bore in the gear housing in which it fits snugly. The generator is then drawn up tight against the housing by three ¼ in.-28 screws which extend through both the housing and cover plate, so it is not necessary to take off the gear cover plate in order to remove the generator. Provision has also been made to prevent oil from the gear compartment getting into the generator. To this end a knife edge is turned on the hub of the generator gear, which throws off any oil passing along the gear hub toward the generator.

As the two pistons connect to the same crankpin and move up and down in their respective cylinders with little phase difference, as it were, there is considerable pumping action in the crankcase, and to prevent oil being forced out through the vent the latter is opened and closed by a rotary valve at the proper periods in the revolution of the crankshaft. The timing of the valve is such that it is closed whenever the crankcase volume



New carbureter specially designed for the U. S. A. motorcycle

Digitized by Google

Pressed steel cover for inlet valve

Exhaust and inlet manifold joints

decreases. Thus there is at all times a partial vacuum in the crank chamber and there is no tendency for the oil to be forced out through the bearings and joints. The distance from the center plane of the engine to the front chain center line is 4 5/16 in.

The inlet valves are located in cages over the exhaust valves and are operated by tappet levers and rods from cams on the same camshaft as the exhaust cams. The main springs of the inlet valves are inside the cages, but there are supplementary springs on the tappet rods which cause these rods to maintain contact with the rock levers and the latter with the cams.

All of the valve springs are enclosed, and, in addition, a pressed steel housing in two parts has been worked out for the inlet valve cages and tappet levers. These housings are held in place by the bolts on which the tappet levers are mounted. The housing fits snugly around the bell-shaped inlet valve cage and is clamped under the head and nut of the tappet lever bolt. The bolt is drilled out for wick oiling and has a reservoir with clip cover in its head which comes outside the housing, so the latter does not interfere with lubrication. In fact, the whole inlet valve assembly can be removed without first taking off the cover.

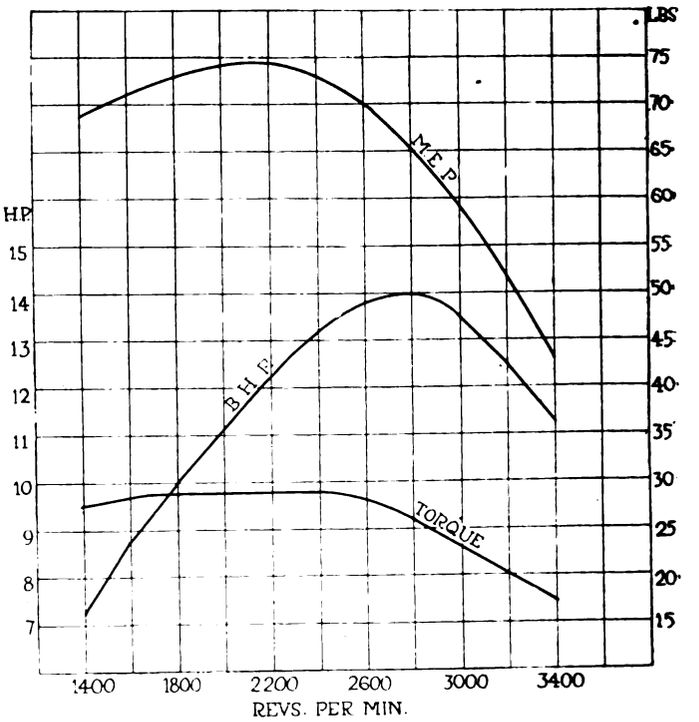
Flared Tube Joints for Manifolds

Instead of the flanged joints for inlet and exhaust manifolds which are universal in automobile and truck practice, flared tube and gland type joints are used for the exhaust and inlet pipes. The exhaust outlet on both cylinders extends downward, as this is the direction the exhaust pipes must take, and hence the number of right-angle turns in the exhaust passage is kept down to a minimum.

Into this outlet is screwed a steel nipple with a hexagon on its outside which serves also as a flange that bears against the casting. The outer end of the nipple is tapered to receive the flared end of the pipe and a nut with a female taper screws over the nipple and securely holds the exhaust pipe in place.

The inlet pipe joint is similar, but the nipple, instead of being tapered on the outside, is tapered on the inside, and a gland ring on the smooth-turned end of the pipe is forced into the nipple by the gland nut screwing over the nipple. This form of joint has one great advantage at this point. The inlet pipe connects to both cylinders and the distance between cylinders will vary slightly, which causes no inconvenience with this joint.

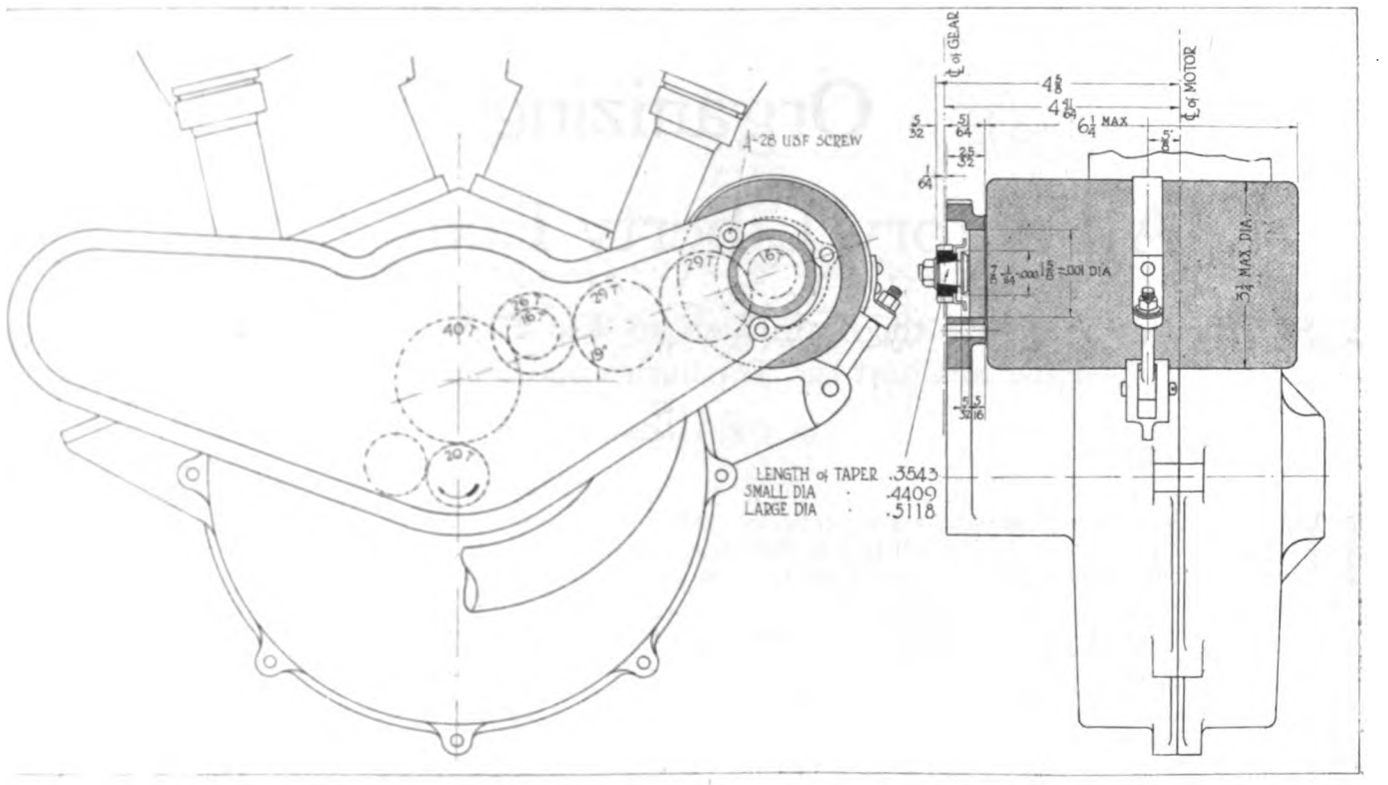
Lubrication is effected by a plunger pump which is built into the gear cover plate and driven by a worm and worm wheel from the magneto drive gear. A rotary valve is used for the oil pump, which is in one piece with the worm gear of the drive, and it can hardly be doubted that this type of valve is more dependable than the more common ball check valve type.



The oil is taken by the pump from the supply tank combined with the fuel tank and fed into the gear compartment on the engine and into the crankcase. As the oil is fed to the crankcase continuously there is always a certain amount in the case which is picked up by the revolving flywheels and distributed over all interior parts.

Hand Pump for Additional Oil

A hand pump is also to be carried on the motorcycle, to permit of delivering additional oil to the crankcase in climbing long grades or when the engine is working under other difficult conditions. In all the illustrations of testing stands herewith may be seen a hand pump mounted on the stand by means of which one of the testers could inject oil occasionally when the supply in the engine seemed to be running low. At the bottom of the crankcase is a shallow oil well into which a drain plug screws from the side of the case.



At the present time practically all motorcycles are fitted with a certain make of carbureter which seems to fit the conditions of motorcycle work particularly well, and the probability is that this carbureter will also be used on the U.S.A. motorcycle. It is of the type in which the needle valve in the spray nozzle is lifted by a cam mechanism actuated by the throttle valve.

It is now planned to use an air cleaner or strainer on the carbureter air inlet so as to keep dust and gritty matter out of the cylinders. This is particularly desirable on a motorcycle because it may happen that a rider on striking a sandy stretch of road may fall, the air inlet coming down to the sand and the motor continuing to

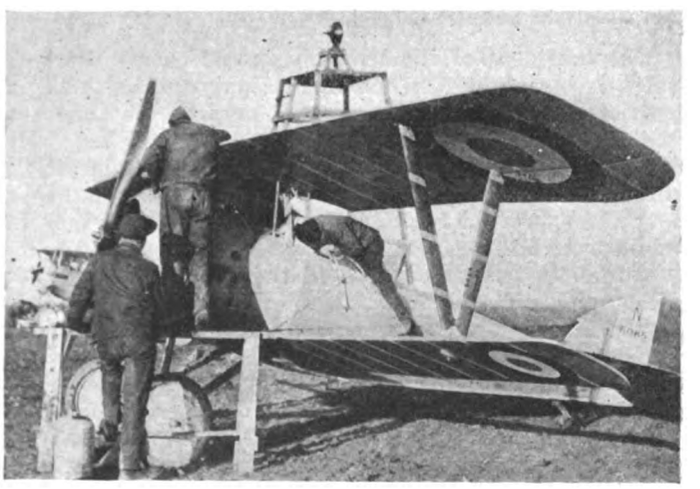
Horsepower torque and m.e.p. curves of engine with equipment finally selected

Digitized by Google

Drawing showing generator mounting and drive

run may draw in sand which will ruin it in short order. Aside from this eventuality, the roads and tracks over which military motorcycles are compelled to travel, often in squadron formation, are apt to be very dusty in summer time and the fitting of an air cleaner would seem to be an excellent idea, if it does not materially reduce the engine power.

The make of carbureter referred to has had two separate air inlets, but in order that all of the air may be strained by a single cleaner the maker has brought out a special model in which the two air inlets are combined into one. From this inlet connection is to be made to the air cleaner by means of a flexible tube.



Several changes have been made in the carbureter to add to its efficiency. Thus a low speed adjustment has been provided by making the cam in the form of a bronze spring with screw adjustment. The throttle valve shaft is made of tobin bronze instead of brass and the throttle shaft bearing surface has been increased. The float valve is 35 per cent nickel steel to obviate rusting.

In one series of tests the engine developed a maximum power of 15.3 hp. at 2900 r.p.m. This corresponds to a piston speed of 1750 ft. per m. and a mean brake effective pressure of 65.6 per sq. in. Whether the equipment used during this test will be the regular equipment is still undecided.

Experiments are being conducted with three different designs of inlet manifold, with different carbureters, carbureter air valves and dust separators. It is the intention to use a dust separator if one can be found which does not decrease the power too much. The attachment of an air cleaner to the carbureter alters the suction curve and as the carbureter is of the type in which the gasoline flow is regulated by a needle valve lifted by the throttle through the intermediary of a cam it is likely that the cam outline will have to be changed. In a preliminary test run with one of the air cleaners the setting of the carbureter had to be changed with almost every increase in speed to get the best power results.

The final selection of equipment will be made not entirely on the basis of maximum power developed but also in accordance with the pulling power and smoothness of operation of the engine at low speed, easy starting and other characteristics.

The engine design for the U. S. A. military motorcycle is the work of the Motorcycle Division, Engineering Department, Quartermaster Corps, which occupies offices in the Union Station, Washington, D. C. This was formerly the Military Motorcycle Standardization Board, its members being William S. Harley of Milwaukee, Wis., Oscar Hedstrom of Springfield, Mass., and Frank Schwinn of Chicago, with Capt. F. C. Hecox representing the Army. Since the establishment of offices in Washington, Charles Franklin has been in attendance for Mr. Hedstrom most of the time, as Mr. Hedstrom's business does not admit of continuous absence, and A. W. Herrington has also been taking part in the work, having charge of all tests.

Organizing
A Factory Liberty Loan Drive

Method of Planning the Campaign to Tap Every Source in the Plant —How to Chart the Territories and Distribute Them

By J. Edward Schipper

HANDLE the Liberty Loan Drive systematically. A wonderful showing can be made if this is done, not only for your company, but, if carried out throughout the industrial plants, for the whole nation.

A simple, direct organization, well balanced, and with its roots tapping every source, will work wonders. Study the method herewith, and adapt it to your factory. You will be gratified with your success, and the company behind you will feel a thrill of pride in a truly patriotic and intensely useful accomplishment.

The loan drive starts Saturday, April 6, and will continue for three weeks. By April 1 your organization should be complete, with toes to the mark, ready to start with a dash at the flash of the gun, never to let up until Saturday, April 27, when the drive will be over.

Herewith are charts showing how to divide your company into territories. If your company has an organization chart, this is already done for you. If it has not a chart, the sample charts herewith will show you how to make one up. The organization must be first charted before you attempt to map out your company for the drive.

After the chart of the organization is in mind the chart for the Liberty Loan Drive can readily be made up from it, as illustrated herewith by the Packard example, where the chart of the organization is given, and a parallel chart for a typical suggested loan sales organization is shown with it. There must be a supreme head to the organization, and the best results are obtained if one man is picked for the job and given full responsibility.

Let President Select Manager

The president of the company should choose the best sales executive he can find in his company and make a patriotic donation of the greater part of his time for the three weeks during which the drive will last. He is put in charge of all matters pertaining to the drive, and has for his direct assistants an advertising manager and a treasurer, or accountant, who act as his advisers in addition to handling the duties hereafter described.

Authority must be vested in the Liberty Loan Sales Manager to pick his entire staff. He divides the organization into territories, which are really departments and sub-departments of the company. As he must make his sales campaign intensive in the highest degree, he must make his territories relatively small. Every one in the factory and office force is regarded as a prospect, and naturally every one must be reached and solicited.

In a big organization a number of sub-sales managers should be appointed. These would correspond to the branch managers in a sales organization which spread over the country. These men in turn divide the territories over which they have control into smaller territories, and appoint the sales managers for these. If these sales managers want assistants they must have the power to appoint them.

Do Not Rely on Volunteers

Like organizing an army quickly, it is imperative not to wait for volunteers. The volunteer system has been found to be useless. Volunteers will not make our drive on Berlin, and volunteers cannot be relied upon to make our drive at home. The president of the company, and its board of directors, must stand squarely behind this issue, and should make it a part of the business of the organization. Direct appointments selected in accordance with the fitness of the men for the work should be the method employed.

It is needless to point out here what interest industry in general has in the succcess of this new drive. The eyes of the world are on us; Teutonic eyes as well as those of the allied and neutral nations. Not to more than succeed would be giving the most effective kind of comfort to the enemy. The war has poured millions into the coffers of certain forms of industry, and naturally out of these same coffers must be loaned, not given, the millions necessary to successfully force the issue.

In a small factory it will not be necessary to divide the territorial underbranch managers. In a large organization it is better to do so in order to keep the entire work in hand and to make the campaign more intensive. As soon as the Bond Sales Manager has been appointed he should provide himself with a complete chart of the organization, in accordance with the plan shown in the charts herewith. He should make a study of this chart and then divide it into logical branches. It is good practice to make the branches and territories correspond to departments of the business rather than to attempt to divide the factory into geographical territories, such as floors and sections of floors. The reason for this is that the men and women in the same departments know each other better, and the sales are thus facilitated.

Chart the Territory

After the territory has been mapped out by the organization chart the number of sub-salesmen should be determined. In a fairly large concern, the branch manager selected should appoint a man in each of the sub-departments. For instance, in an automobile factory there may be a branch sales manager in charge of the manufacturing territory. This would include everything which would be classified on the organization chart under the head manufacturing, and would embrace, as

Digitized by Google

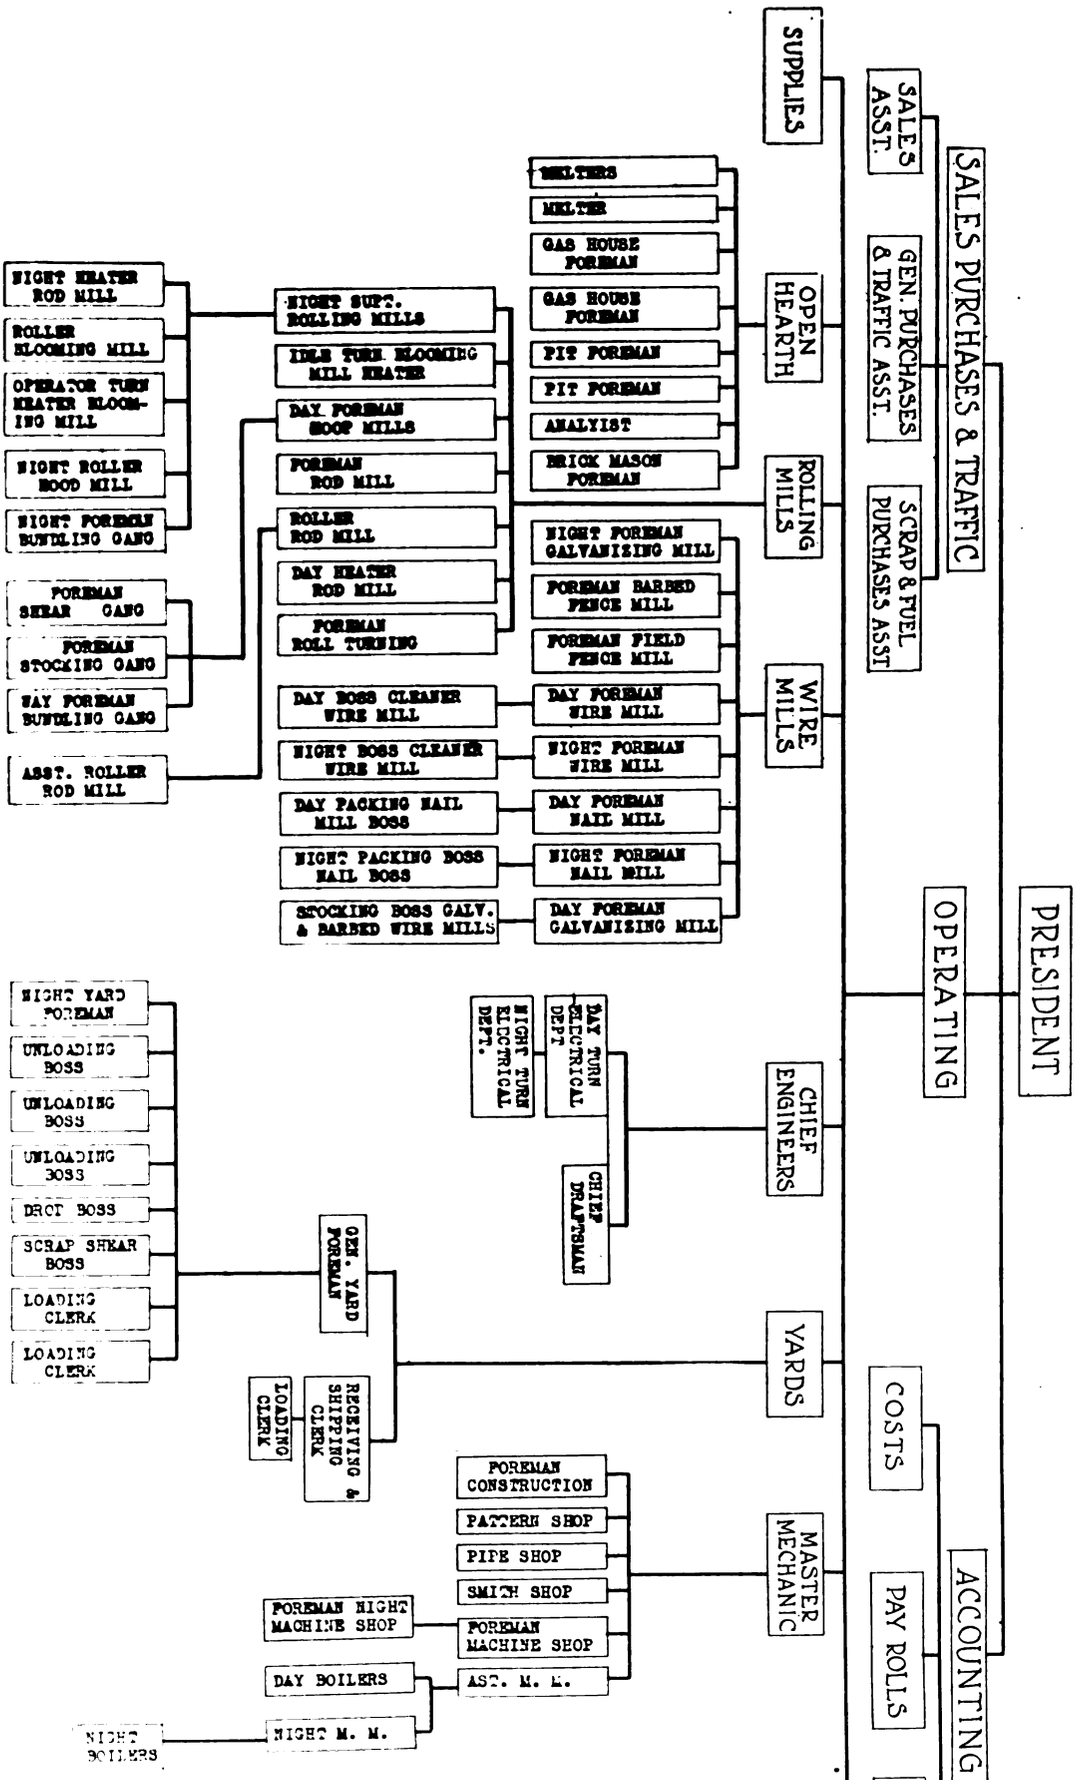

Fig. 1—A chart of the complete industrial organization of the factory should be the foundation upon which to build up an effective Liberty Loan Drive plan. This is a typical chart of the kind. With such a chart as a basis, the various territories in which the several committees and sub-committees are to operate can be visualized and clearly mapped out beforehand

Digitized by Google

in the instance of the Packard, which is taken as typical, the following divisions:

MANUFACTURING TERRITORY

Carriage	Forge and foundry	Purchasing
Chassis	Service	Traffic
Body	Mechanical	Labor
Truck	Construction and maintenance	Welfare
	Material and laboratory	
	Production	

These departments are handled by a sub-branch manager, or a sub-dealer. If the number of men under any particular sub-dealer is large, he in turn should have salesmen. The sale must be made in the highest degree intensive. Every man in the organization, from the president down to the laborer, should be seen, not once, but many times, during the campaign, so that when the final day comes as near 100 per cent as possible should be obtained.

The sales campaign is handled directly, as far as policy is concerned, by the Bond Sales Manager. His authority should be absolute. More than that, he should have the backing and the indorsement of his company. Under his direct command he should have a competent advertising manager. The advertising manager of the firm will generally be the best man on this job, or a good live, enthusiastic young fellow from the copy department will oftentimes be glad of the opportunity to distinguish himself on this work.

The house organ, if there is one, should get out a daily newspaper, circulated to every man in the company, telling of the progress of the campaign, listing the names of those who have bought, those who have taken 100 per cent or more of quota, and generally keeping every employee informed and enthusiastic. The advertising manager should get this out, and he should in turn have a staff of reporters to help him. His reporters may oftentimes be salesmen, but it is just as well to have men who are not bond salesmen doing this work. It will have more people working.

Have Everybody Take an Active Interest

Do not be afraid to have the people in the factory working on this. The more that are working the bigger the results. Do not worry about the decrease in business because of the distraction of attention. In the first place, the cause is perfectly worth shutting down the plant, were that necessary; but when enthusiasm is worked up work will proceed faster. In fact, the results are more apt to be a gain in productive activity rather than a loss. Enthusiasm as regards a project only comes from working on it. It is impossible to have a man enthusiastic on the Liberty Loan question if he sits back in his chair while others about him do the work. Get as many men and women as possible in the plant to help.

It will be the duty of the advertising manager to advertise the drive. He will also be editor of the daily edition of the house organ; or, if there is no house organ, the daily bulletin news sheet which should be published. He will also print posters and put them around the plant. It is best to change these every day, if possible. If the sales manager puts on a contest, as he should, between the various branches or territories, the advertising manager should put his shoulder to the wheel and urge on the contestants by reporting in the daily edition of his newspapers the standings of the teams and the methods used by each to succeed.

The branch or department sales managers have direct charge of all sales in their respective departments. In consultation with the sales managers they arrange the quotas for their territories and appoint the sub-dealers or salesmen under them. As stated, where the territo-

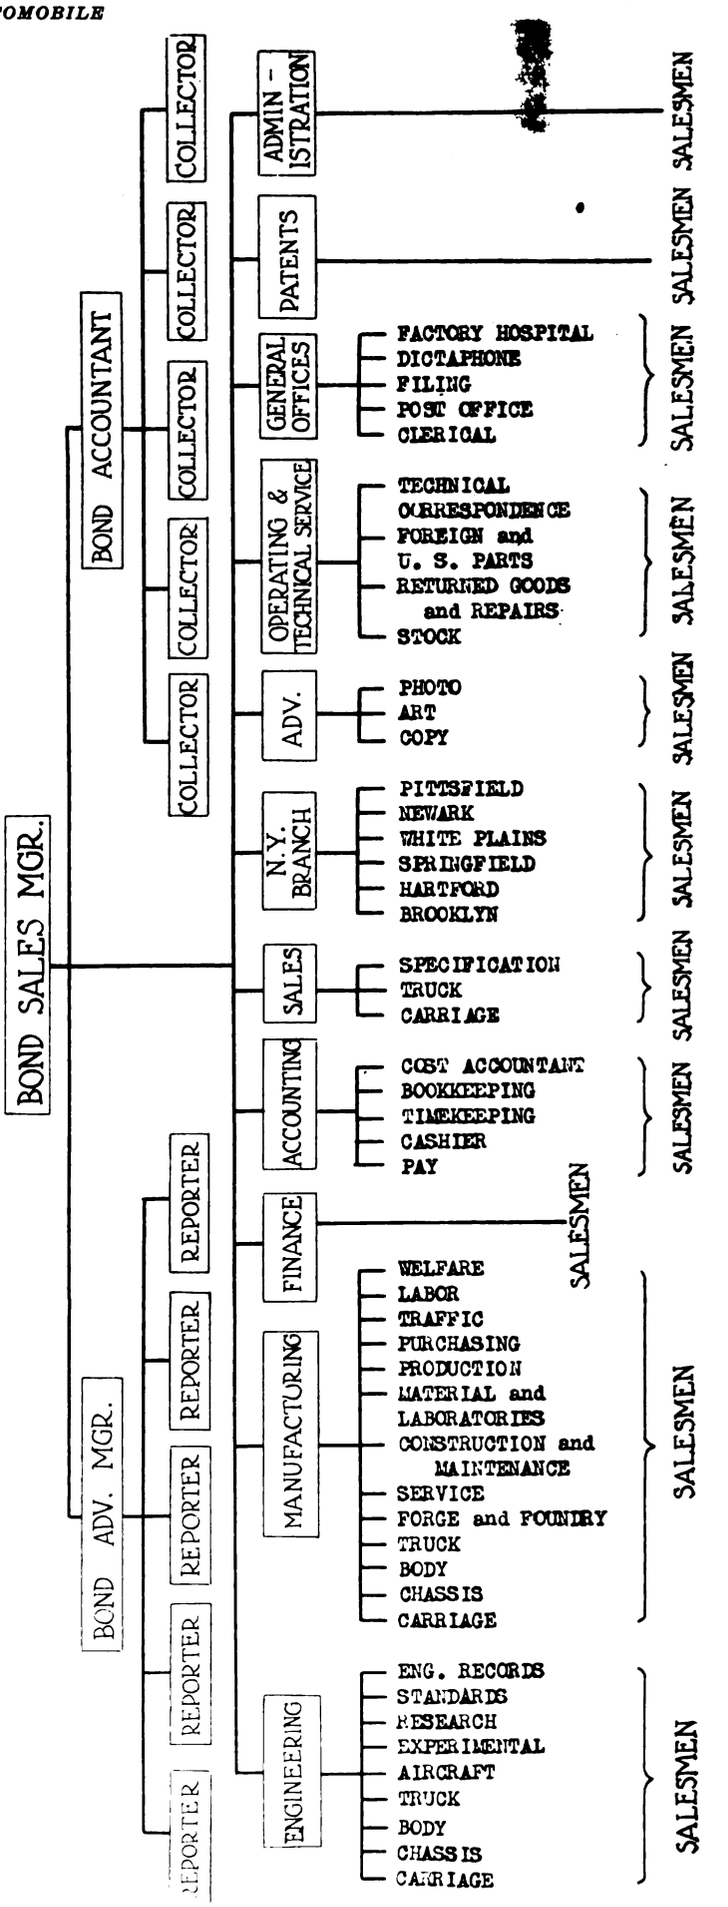

Fig. 3—Suggested chart for a Liberty Loan organization derived from the chart given in Fig. 2

Digitized by Google

ries under the branch managers are large, such as they will be in the factory departments where large numbers of men are employed, it is always best to divide into sub-branches so that the sale will be on a more intensive scale.

The third branch under the sales bond manager has to do with the finance.

DO NOT ATTEMPT TO MIX THE ACCOUNTS WITH THE PAYROLL. IT WILL LEAD TO TROUBLE.

Even in a small organization endless confusion will result if you attempt to take the money for the Liberty Bonds out of the pay envelope. There is a better way.

The sales manager should appoint a bond accountant. He should be a man who is selected from the financial department. He must handle all the money that has to do with the bonds. This must be divorced entirely from the payroll or other books of the company. If a bond is sold for cash, the transaction is simple. The money is taken in, and the bond, or an advance substitute or receipt, handed out. When the bond is sold on the installment plan, as it usually is, it requires a set of books. These are simple by themselves, but when mixed with payroll accounts and time clerks' reports they are the reverse.

All bond transactions should be numbered. The installment book should have first the number, then the buyer's name, then the amount paid on deposit, and after that weekly blanks to be filled in with the installments paid. A deposit of 10 per cent cash should be required, and the balance at the rate of at least 10 per cent a month. As soon as an order is turned in to the accountant he enters it in his book, assigning the number and crediting the deposit, which must always accompany the order. Certain hours, certain days of the week, should be appointed for paying the installments. In the shop, where the men file past the pay window, it is a very good idea to have another window a short distance away, where the men file past in accordance with the numbers on their Liberty Bond orders. In this case, the bond accountant may need assistants from the pay department.

Summary of Organization

To summarize the organization:

1—There is first a supreme head. He may be entitled bond sales manager, or director of the Liberty Campaign.

2—Under him there are two direct assistants, an advertising manager and an accountant, and as many branch managers as the size and scope of the company necessitate.

3—The advertising manager is editor of the daily newspaper, which may be a special daily edition of the house organ or a regular daily newspaper sheet.

4—The accountant takes care of the books, recording the buyers and the deposits made by them, and also keeps an account of the weekly installments paid by each.

4a—He has as his assistants men who are drawn from the pay department. These he uses to collect money in different parts of the shop. He may set up pay booths or he may use the regular pay booth immediately after the the regular pay has been completed.

5—The branch managers are distributed to take care of the main divisions or departments of the organization. They are the main links in the chain. It is up to them to see that the quotas of the respective territories are sold, and it is up to them to arrange with the bond sales manager the quota of their departments. Under them they appoint sub-branch managers where necessary.

5a—Under the branch managers and the sub-branch managers the salesmen operate.

Borg & Beck Eliminates Clutch Brake

Thrust Bearing Prevents Spinning of Clutch Shaft, Thereby Obviating the Necessity for Friction Device

FEW developments have taken place in the clutch field during the past year, largely because this is one of the parts which give the least amount of trouble. Changes in clutch design were quite rapid during the first few years of the past decade, owing to the fact that the torque characteristics of automobile engines presented a variety of new problems to clutch manufacturers. The increasing rotative speed of automobile engines caused a revision of the earlier methods, with the result that changes were necessitated from year to year, until about 1915, when clutch design seemed to have attained a settled state.

Occasionally, however, minor alterations are made, and those observed during the past year indicate two tendencies, namely, the gradual abandonment of the clutch brake and a decline in the number of clutches with means for adjustment. A good example of these tendencies is found in the new Borg & Beck clutch, in which the clutch brake has been eliminated, thus giving a design which has made very substantial progress over the type used previously.

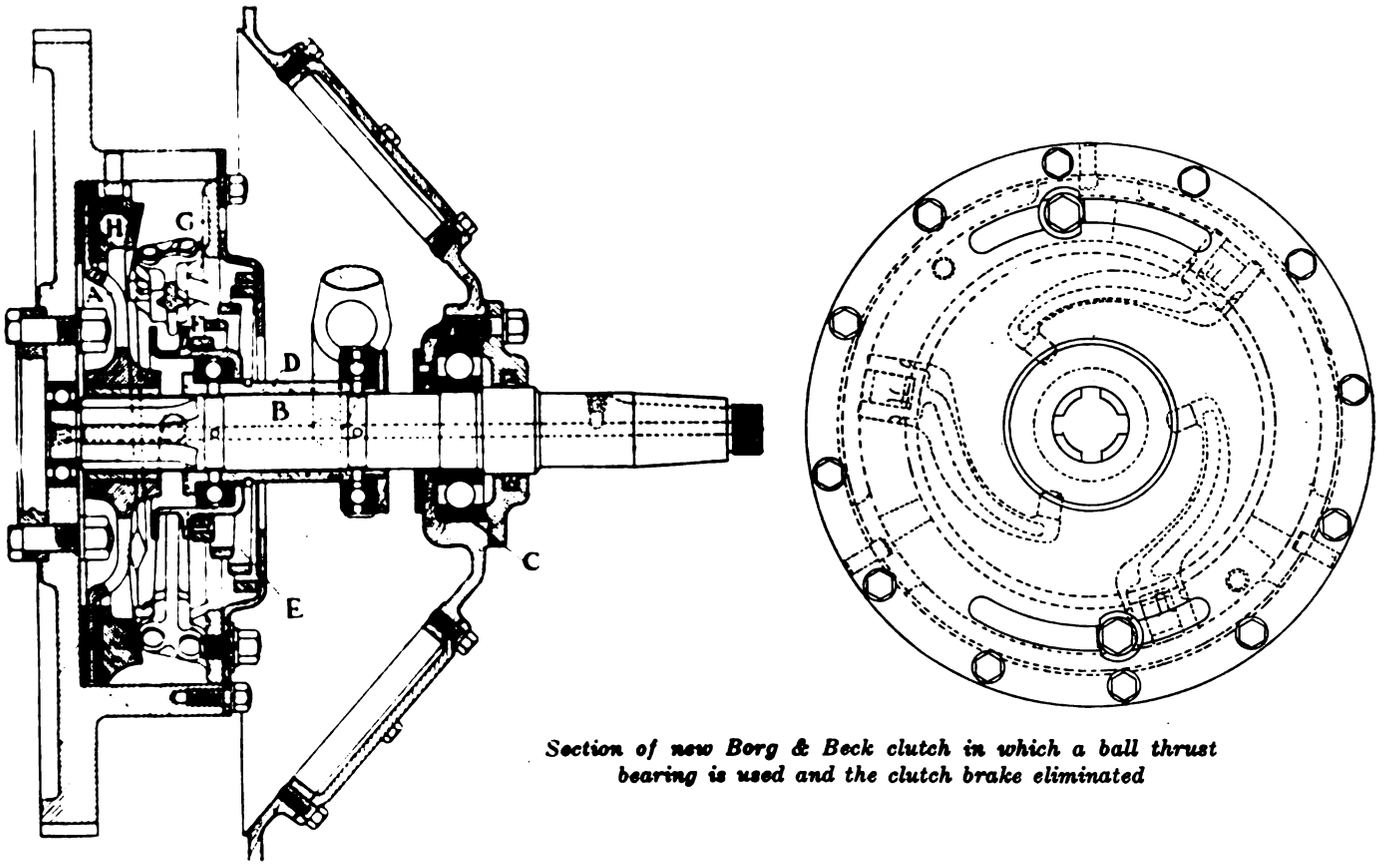
The Borg & Beck clutch is well known from its wide use among manufacturers of assembled cars. The accompanying sectional view shows the construction of this clutch and illustrates the method employed to render practical the elimination of the clutch brake. The principal change made to this end is the addition of a thrust bearing at the inner end of the clutch sleeve, so that there is no friction between the sleeve and the transmission shaft when the clutch is released. When there is no bearing at the inner end of the sleeve, the sleeve rotates around the shaft continually, being driven by the spring pressure. This clutch is mounted in the customary manner in a casing which contains both the flywheel and clutch member, or it can be fitted as a self-contained design in which the clutch itself is in a separate casing which is provided with a mounting flange, through which it is bolted against the flywheel web.

Borg & Beck clutch with clutch brake

Referring to the sectional view, the action of the clutch is clear if it is kept in mind that among the rotatable parts only the driven group, comprising the disk A and the shaft B, can stand still when the flywheel is running. All the other rotatable parts are anchored to the flywheel, and these must revolve and drive with the latter. The clutch brake was formerly mounted at the inner end of the clutch shaft and has been replaced by the thrust bearing shown at C. When the clutch is disengaged there is no friction between shaft B and the throw-out sleeve D, the thrust bearing taking the rotating drag of the clutch shaft, thereby eliminating the necessity for a brake to check the spinning action.

Action of Clutch

When the clutch is thrown in, all the rotating parts are friction-locked into a single combination and revolve as one with the flywheel. The power of the release thrust spring E, acting through the throw-out collar F, and the bell crank pivot G, drives the thrust shoes outwardly with a lever-wedge-toggle combination against the overhanging, inward-beveled face of the thrust ring H. The thrust shoes in making the friction thrust cannot recede as they climb the face of the thrust ring H, since the parts on which they are mounted are backed against the cover wall or rigid end of the clutch casing.



It therefore follows that the full, part-shafting effect of the thrust is communicated to the thrust ring H, and the latter, in being thus driven hard toward the flywheel, sets up between itself and the inner casing wall a friction grip sufficiently powerful to stop the slippage of the asbestos rings upon the polished faces of the disk, thus giving the drive to the car.

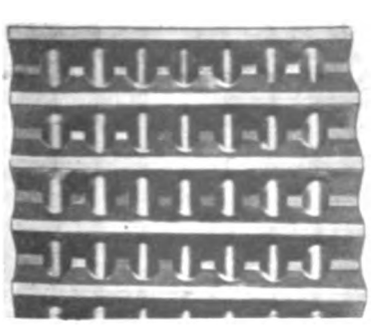
When the pedal is applied for releasing the clutch the retracting parts telescope the coil spring E until it occupies nearly a single plane. The withdrawing parts also release the clutch shoes a sufficient distance from the face of the thrust ring H to permit the latter, together with its companion friction ring, to back away from the disk, thus breaking the friction grip and permitting the parts to come to a stop, while the flywheel and the parts of the clutch anchored to it are left free to revolve idly. The release disk A is so light that it continues to spin only a very short time and does not cause any clashing action in the gears. The full thrust of the spring transmitted through the powerful lever-toggle action to the friction-grip parts is always and easily sufficient to lock the driving, flywheel parts and the driven disk into a fixed, non-slipping relation, for a full driving action; but it is still always within the control of the driver, through the foot-lever, to let the clutch into engagement by degrees; and thus, by a gradual increase of the friction-grip, gradually overcoming the starting slippage, to start the car so gradually as to eliminate everything in the nature of a starting jerk. At the same time that, by reason of the slippage grip, the clutch can be thrown in fast enough to bring the car from a standstill up to city speed within from 25 to 35 feet.

The starting-slippage necessary to obtain a gradual friction-grip calls for an incombustible, non-wearing friction material, and this is provided in the asbestos-friction facings developed in recent years.

Taking-up adjustment is made possible by means of bolts passing through adjustment slots in the cover. When the bolts are loosened and shifted in their cover slots, they control and shift with them an adjustment ring which brings

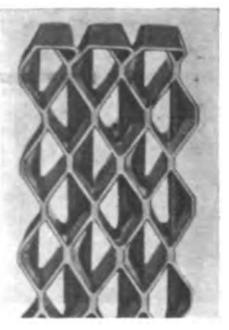
Digitized by Google

Section of new Borg & Beck clutch in which a ball thrust bearing is used and the clutch brake eliminated



all the shoes to new seats against the non-shifting thrust ring; and these seats being further up the inclines of the tapered ring, the ring is necessarily thrust so much further toward the other friction parts, thus compensating for wear.

The throw-out adjustment can be controlled by taking up on the friction grip adjustment, these two adjustments being taken care of by the same mechanical means. The clutch is held entirely out by means of the pedal, and the parts are then free to be shifted in either direction. To take up for wear, the adjustment bolts are loosened and tapped in a clock-wise direction, ⅛ or ¼ in., or any distance required, and then tightened again. These clutches are made up to fit standard bell housings or individual mountings.



—

Spery Radiator Is New Type

A NEW type of radiator, claimed to combine some of the advantages of the honeycomb and tubular types, is manufactured by the Hooven Radiator Co. of Chicago and is known as the Spery radiator. In outside appearance it is very much like the honeycomb type which seems to be preferred for passenger car use. A look at the cross-section, however, shows that the construction is entirely different. The elements of the radiator are zig-zag stampings of sheet metal, into which are stamped depressions which when the stampings are assembled together form vertical tubes. The water circulates not only through these vertical tubular passages but also through the fine passages adjacent to the tube formations.

Tubes pressed in

Front view

Owing to the large tubular passages in the radiator, it is practically impossible for the latter to become clogged. While the Spery radiator possesses some of the advantages of the tubular type, it is free from its liability to injury by freezing, as the narrow passage between adjacent zig-zag walls will expand readily and thus prevent injury. Repairs to the radiator are said to be easily effected, and its construction is such that it will withstand the shocks and jolts due to traveling over rough ground on solid rubber tires. Its immunity from injury by freezing is said to make the radiator particularly adapted for use on airplanes. Great rigidity is claimed to result from the zig-zag construction. The soldered surfaces at the front and back are particularly wide, which makes the danger of leakage comparatively remote. The Spery radiator is said to have from 35 to 40 per cent more water capacity than either the honeycomb or tubular type, but the basis of comparison is not stated.

—

Quantities of Material Handled by Ford

SOME idea of the size of the Ford scrap pile may be formed from the fact that the tailings or steel trimmings that come from the lathes and other machines average 100 tons daily; cast iron borings, 25 tons, and sheet steel clippings, 50 tons. The total sales of scrap material from the Ford factory last year approximated $3,000,000 in value. This is in addition to an enormous amount of cast iron borings and baled sheet steel clippings consumed in the foundries of the Ford company. Figures indicate that for every Ford car manufactured waste material valued at about $4 is produced.

To manufacture the scheduled 90,000 cars, it would require over 400,000 tons of steel; over 126,000,000 sq. ft. of material for tops; 3,600,000 wheels and tires each; 4,500,000 lamps; 15,884,414 ft. of vanadium steel shafting and axles; 4,938,000 sq. ft. of glass for windshields; 109,484,404 ft. of copper tubing for radiators; 12,900,000 lb. of steel for magnetos, 30,838 miles of wire for magnetos; 7,836,593 sq. ft. of galvanized metal for gas tanks; 69,959,951 sq. ft. of sheet metal for fenders and guards; 27,940,382 ft. of tubular radius rods.

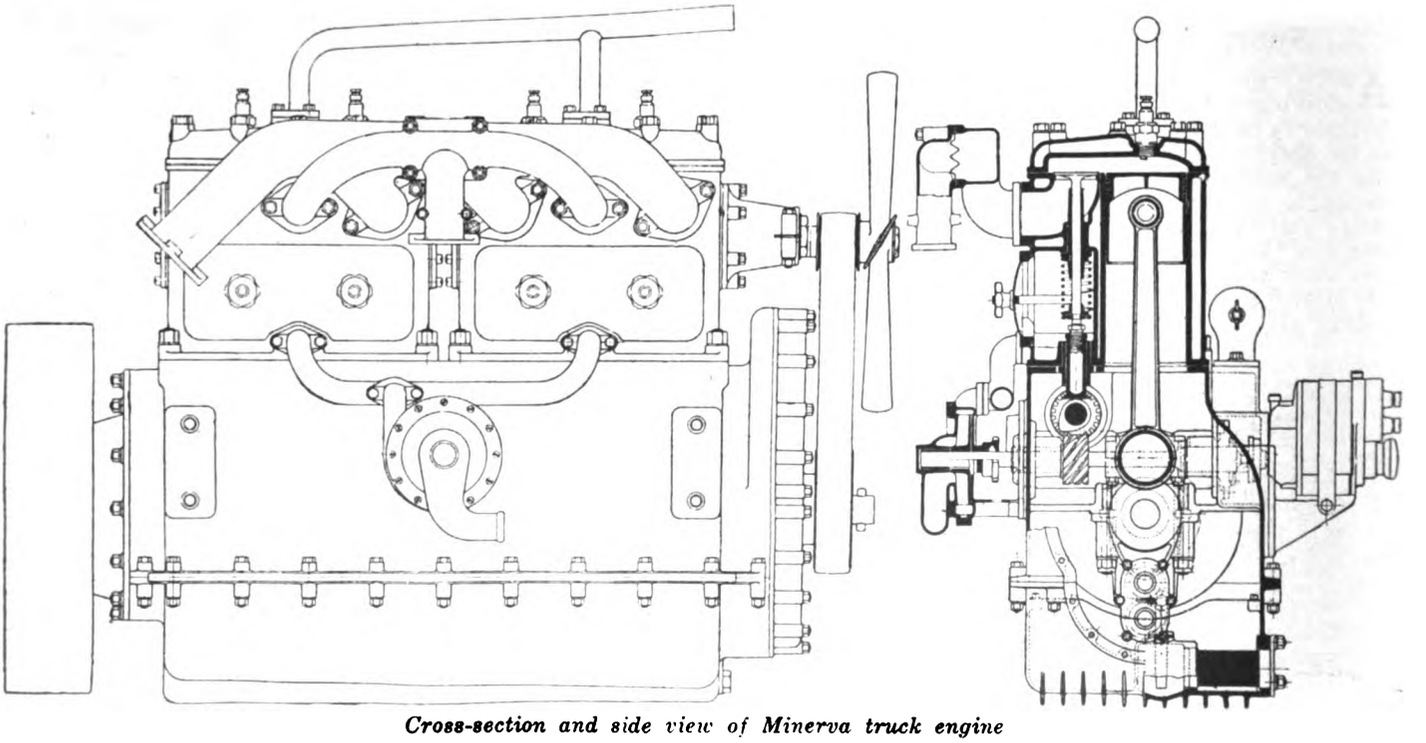
Details of the Minerva Engine

A New Design Intended for Heavy Duty Only—Large Handholes in Cast Iron Crankcase, Magneto Ignition and Combined Force Feed and Spray Lubrication

IN its general design the Minerva engine follows lines of standard practice for unusually hard service. No radical innovations have been attempted; the requirements of tractor and truck service have in all cases determined the construction employed, and the Minerva is recommended by its makers only as a tractor and truck engine and for certain classes of marine work.

The cylinder bore is 4 in. and piston stroke 5½ in., giving 276 cu. in. displacement. L-head type cylinders are employed, with detachable heads. The cylinders are cast in pairs and have the waterjacket extend all round and down their entire length. The crankcase is a gray iron casting and is parted in a plane below the crankshaft axis. This permits of inspection holes in such positions as to allow direct and easy inspection of the main and connecting-rod bearings. All main bearings are carried by the upper section of the crankcase and the bearing supports are ribbed to the sides of the case, the ribs extending below the center line. Owing to the fact that pads for supports are machined both in front and rear, the engine can be easily mounted in almost any tractor or truck frame. The lower section of the crankcase serves as an oil reservoir and also contains the oil strainer.



A three-bearing crankshaft is used; it is mounted in ample bronze-babbitt bushings and so constructed that the center bearing takes the entire thrust and allows for expansion or contraction of the shaft. At the rear end a large integral flange is provided, to which the flywheel is secured. This flange also prevents oil leakage at the rear end. I-beam section connecting-rods are used and the caps are fitted with four bolts. Adjustment is accomplished by means of laminated shims inserted between rod and cap, these shims being used also under the main bearing caps. At the wrist pin end the rod has a bronze bushing.

Gray iron pistons are fitted, each having three expansion rings. The pistons are also substantially ribbed. Large diameter valves insure high volumetric efficiency. The valves have a 45 deg. seat and are actuated by the camshaft through mushroom-type cam followers. Separate valve guide bushings are used, and provision is made for adjustments through cover plates on the cylinder blocks. The cams are integral with the shaft, which is mounted in four bearings and driven by spur gearing. Water pump and magneto drive is by means of a shaft placed at right angles to the camshaft, which brings the pump and magneto on the center line between the pairs of cylinders, the pump being on the right and the magneto on the left side of the engine. The driving gears are of the helical type, the driving pinion being of steel and integral with the camshaft, while the driven gear is of bronze and mounted on the cross shaft. Both ends of the cross shaft are carried in large-diameter plain bearings, and a ball thrust bearing takes the thrust of the driving gear. This construction makes it possible to remove the water pump without disturbing the magneto, and vice versa.

The water pump is of the centrifugal type, fitted with self-lubricated bearings and driven through flexible coupling from the cross shaft. Cool water enters the cylinders directly under the exhaust valves. The stuffing box on the pump is easily accessible and can be repacked without disturbing the pump. A high-tension magneto serves for ignition, and all high-tension wiring is incased in tubing.

Lubrication is in the main of the straight force-feed, high-pressure type. A gear type oil pump is cast integral with the front bearing cap and is driven by a spur gear which meshes with a gear on the crankshaft, the pump speed being slightly higher than engine speed. Oil enters the crankshaft through the front bearing and is distributed to the crankshaft, connecting-rod and wrist pin bearings. Oil is taken from the sump through a screen which can be easily removed for cleaning. Provision is also made for draining both sump and suction chamber separately. Other parts of the engine, such as connecting-rod bearings, valve guides, etc.,

Tractor Gear Teeth and Materials

Heavy Service Demanded of Tractor Transmission Calls for a Liberal Factor of Safety—Materials Available for Gears and Their Properties—Different Tooth Forms Used

By A. W. Scarratt

THAT a farm tractor transmission does as much work in 1 year as an automobile transmission would have to do in 200 years was the startling statement made in a paper read before the Minneapolis S. A. E. section at its March meeting by A. W. Scarratt of the Minneapolis Steel & Machinery Co. The author's object was to draw attention to the severe service to which the gears of a tractor transmission are put and to explain the reason for making them strong and heavy. Says Mr. Scarratt:

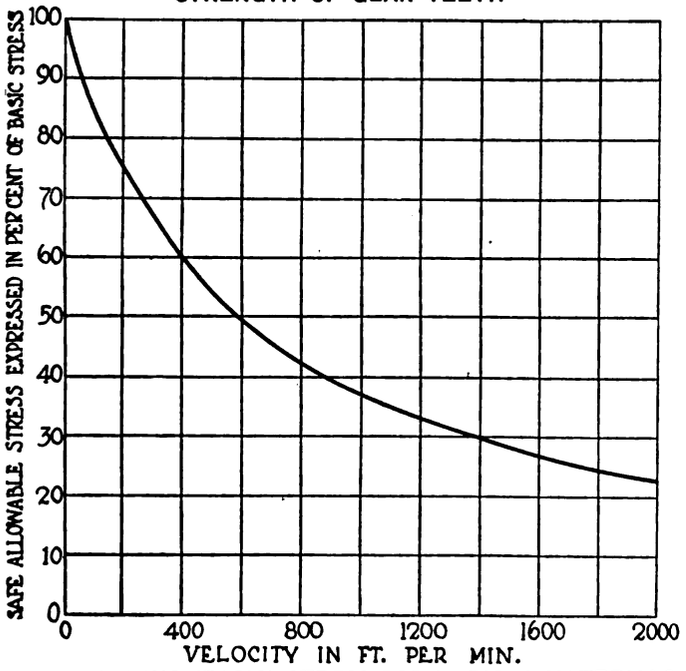
IT is true that tractor transmissions have been heavy and crude, and that as a result the weight of the machines was high and the efficiency low, but it must be borne in mind that the large gas tractor of to-day is an outgrowth or revision of the steam threshing and road engine of twenty years ago, plus improvements, and not an offspring of the automobile. However, one cannot help but realize the advantages of refined engineering and quality of materials and construction, and of standardization, as exemplified in the modern automobile, and it is for these reasons that there is such a revolution in tractor design.

From the foregoing remarks it will be seen then that when laying out the gearing, careful judgment and good engineering are very essential, if high efficiency, minimum weight, and satisfactory service are to be obtained. Speed, torque, and space limitations, manufacturing facilities, and selling price will all have their influence on the type of gears and the material used in them. Of material the engineer has a considerable choice, and he also has several types of gear teeth to choose from. Materials for gears range all the way from paper, wood, cloth, hide and compositions to the finest alloy steels. Each has some advantage, be it strength, cost, operation, ease of production or wearing quality, and each tooth shape has some point in its favor.

Common Materials Suitable

Table A shows several of the common materials suitable for tractor gears, with the tensile strength, yield point, machining properties and characteristics of each. It will be seen that the variation in strength is great, but actually it is greater in practice than even these figures show, because of the necessity, when using the metals of low strength, to employ a larger factor of safety than is required when using the metals of greater strength, because of the variance in physical properties to be found in the lower grade materials. The physical properties of any of the carbon steels and alloy steels can be varied considerably to suit the designer's requirements, so that the figures given do not apply to all cases. The strength desired is regulated in the heat treatment by the drawing temperature used, the low drawing temperatures giving steels of high tensile strengths, high elastic limits and good hardness, but at a sacrifice of some of the toughness. The higher drawing temperatures decrease the tensile strength, elastic limit and hardness, but will materially increase the toughness. Therefore, in choosing the material for a gear, careful consideration must be given to see that it has the proper strength for the loads imposed upon it, proper hardness to insure reasonable service and proper dynamic properties to resist impact and fatigue. Here is where we lack much information.

Certain materials seem to be satisfactory for automobile gears, in view of the small amount of service they get, but it is questionable if gears made of similar proportions and of the same materials working under full load torque all the time, and, therefore, under much greater surface pressures, will last as long as they should in tractor service. It seems to the writer that experiments should be made which would give some definite data on the relation of surface pressures and the degree of surface hardness necessary for a given length of service. These properties must bear some reasonable relation to one another for any given material, and certainly private investigations have been made which have brought forth information on the subject which would be of great value to the engineering profession.



There is also much information lacking on the subject of the strength of gear teeth. On account of the various shapes of teeth, no common rule can be used in figuring their strength and the problem becomes a complex one. For instance, we have the Brown & Sharpe 14½° tooth, the Grant 15° tooth, and a 20° tooth, all of which are of equal length

TABLE A
Materials for Gears

Material	Tensile Strength, Lb.	Elastic Limit, Lb.	Machining Quality	Characteristics
Close grained cast iron	24,000	.....	Cuts freely Good surface	Easily obtained — low cost—satisfactory for low pressures.
Close grain semi steel	31,000	.....	Cuts freely Good surface	Easily obtained — low cost—satisfactory for high or low speed and low pressure — wears well.
Cast steel	60,000	31,000	Machines good when annealed	Medium priced—strong and tough, loss due to defects sometimes large. Wears well—satisfactory for low speed—low pressure.
Carbonized and Heat Treated				
0.020 carbon steel, S. A. E. No. 1020	75,000	43,000	Care needed to avoid tearing	Affords good combination of strength, toughness and hardness. Good for high speeds and medium pressures.
Heat Treated				
0.35 carbon steel, S. A.E. No. 1035	95,000	65,000	Machines good when annealed	Good combination strength, toughness and hardness. Good where high speed or heavy pressure prevails.
Heat Treated				
0.45 carbon steel, S. A.E. No. 1045	110,000	75,000	Machines good when annealed	Excellent strength, but more brittle than the previous steel. Suitable for high speeds and for steady heavy pressures. Wears well.
Heat Treated				
3½% nickel steel 0.20 carbon	130,000	99,000	Cuts hard with fine surface	Excellent strength, toughness and hardness. Very satisfactory for high pressures.
Heat Treated				
3½% nickel steel 0.40 carbon	155,000	130,000	Cuts hard with fine surface	Excellent strength, toughness and hardness. Suitable for very severe conditions; good for clash gears.
Heat Treated				
Nickrome forging steel	150,000	130,000	Machines good	Same physical advantages as above—easily heat treated. Excellent wearing qualities.
Chrome vanadium steel	190,000	150,000	Machines good	Same physical advantages as above—easily heat treated. Excellent wearing qualities.

VALUES FOR FACTOR S IN THE LEWIS FORMULA FOR THE STRENGTH OF GEAR TEETH

SAFE WORKING (BASIC) STRESS FOR VARIOUS MATERIALS

	Lbs. per Sq. In.		Lbs. per Sq. In.
Raw hide	5,000	Bronze	12,000
Cast iron	8,000	Cast steel	20,000
Cloth	18,000	Forged steel (Not treated)	25,000
Semi-steel	10,500		

and which agree in all proportions except for the pressure angle. This, of course, varies the strength of the tooth in the ratio of the squares of the root thickness, which is the critical section of the tooth when figured as a cantilever beam, the load being applied at the outer edge of the tooth. In a rack gear of any given width, the 20 deg. pressure angle tooth is practically 25 per cent stronger than the 14½ deg. tooth. This ratio is not constant, however; in fact, it becomes slightly greater as the number of teeth in the gear becomes less. This is one advantage in favor of the 20 deg. pressure angle.

The most commonly used formula for these particular types of teeth is that originated by Wilfred Lewis,

$$W = SPFY\frac{600}{600+V}$$ in which,

W = safe tooth load.
S = safe stress in lbs. per sq. in.
P = circular pitch in.
F = face.
Y = factor depending on the number of teeth in the gear and the pressure angle used.

This factor Y is governed entirely by the number and shape of the teeth. Tables of these values are given in all handbooks. The values of S for different materials, starting with cast iron, and for various velocities are given in the accompanying diagram. These values I believe can bear criticism for the reason that the allowable stress drops with an increase in speed in the same ratio for every material regardless of its physical properties. This certainly should not be the case. When we consider the ability of such materials as chrome vanadium steel to resist impact forces, as compared to the relative inability of other materials, such as cast iron, it seems absolutely foolish to apply the same rule to both. In fact, several large manufacturers to-day do not adhere to the Lewis recommendations for the allowable stress.

Previously we have seen the value of increasing the pressure angle when considering the strength of the gear tooth. Another way of increasing the load carrying capacity of the tooth is by shortening it in a manner similar to the Fellows 20 deg. stub tooth standard. The word standard as applied here is a joke, as the so-called Fellows system is far from a standard. However, they realized the value of the short tooth and made a system of tooth sizes which, as you know, uses the addendum, dedendum, and clearance of a small tooth in combination with a tooth of large pitch. The Fellows stub tooth system comprises the following tooth sizes: 4/5, 5/7, 6/8, 7/9, 8/10, 9/11, 10/12, 12/14. It will be seen that there is no definite ratio between the height of the tooth and its pitch, such as prevails in the Brown & Sharpe system.

Why should we not have a standard 20 deg. stub tooth which does have definitely fixed proportions based on the pitch, such as is exemplified in the 20 deg. stub tooth, proposed and outlined in the *American Machinist*, in June, 1907, by an eminent authority, Charles H. Logue? Another disadvantage with the Fellows system is that the range of tooth sizes is not adequate, especially in tractor work. The writer has been forced on several occasions to use stub teeth of larger pitch than any given in the table, these sizes being the 3/4 and 2/2½ pitch. Another disadvantage in the present stub tooth system is that there is no convenient or accurate formula for figuring the strength of these teeth, and there cannot be until considerable investigation has been made.

The customary practice has been to figure the strength of the regular 20 deg. tooth and then increase this strength in the proportion of the inverted pitch fraction of the stub tooth. This does not give the correct strength, as it assumes the root thickness of the full length tooth and stub tooth to be alike, and this is not the case. The root thickness of the 20 deg. stub tooth is less than that of the 20 deg. full length tooth of equal pitch measure, and, consequently, it has a smaller section modulus.

In thus harshly criticising our present gear tooth practices, it is hoped that a general discussion of the subject will be created, with a view of bringing out valuable individual information on the subject generally.

The writer feels that there is certainly room for great improvement and much enlightenment on this subject through research work, if we are really going to use our valuable resources to the very best advantages.

—

Italy's Exports Growing

ITALY occupies the position of the leading motor car exporting nation of Europe, according to official figures issued by the Ministry of Finance. For the first eight months of 1917 her motor exports increased 113.4 per cent, as compared with the corresponding period of 1915, and 96.4 per cent as compared with the first eight months of 1916. The largest proportion of vehicles consisted of motor trucks dispatched to the various Allied Powers. They numbered 6169, and had an average value of 14,375 lira each. Touring cars totalled 506 for the eight months, their average value being 17,568 lira each. They were practically all fully equipped cars for Allied staff service. Imports of motor vehicles into Italy were, on the other hand, low, the value being only 1,073,500 lira for 183 vehicles, of which ten were trucks. These figures show a drop of practically 70 per cent, as compared with 1915. It is rather curious to note that the average value of the motor trucks imported into Italy works out at the low figure of 2000 lira each, and that the average value of the touring cars is 6263 lira, or only a little more than one-third of that of the exported article.

Details of the Minerva Engine

(*Continued from page* 586)

are lubricated by spray, which is thrown from the crankshaft. The oil-filler pipe and breather pipes are designed with a view to preventing dust and dirt entering the crankcase. The governor is operated by pressure from the oiling system.

Heat from the exhaust gases is used to pre-heat the incoming mixture in the intake manifold, which latter is of the down-draft, hot-point type. At the point of division between front and rear cylinder blocks, a deeply corrugated baffle-plate is inserted and this plate, being heated by radiation from the exhaust manifold, serves not only the usual purpose of diverting the incoming mixture, but also to accomplish more thorough vaporization of the fuel particles.

The Minerva engine is the product of the Minerva Engine Co., Cleveland, Ohio.

New French Vineyard Tractor

Double Worm Drive in Rear Axle—Tread 37 Inches—Spring-Suspended for Roads

By W. F. Bradley
Paris Correspondent of AUTOMOTIVE INDUSTRIES

PARIS, March 1—Official France realizes that during the next few years thousands of agricultural tractors will have to be put into service in order to relieve the shortage of labor caused by the war. At the present time most of these tractors are being brought from abroad, owing to the inability of the home factories to produce. Immediately after the war, however, it is intended that France shall produce her own tractors, and already business men and factory owners are studying this question and automobile manufacturers in particular are turning to the agricultural tractor as an article which is likely to keep their enlarged factories busy. On the other hand, the French Agricultural Department is encouraging inventors to produce tractors suitable for French conditions, and has instituted a technical section which examines all new designs, reports on them, and when considered suitable endeavors to interest manufacturers in their production.

Vertical and horizontal sections through rear axle

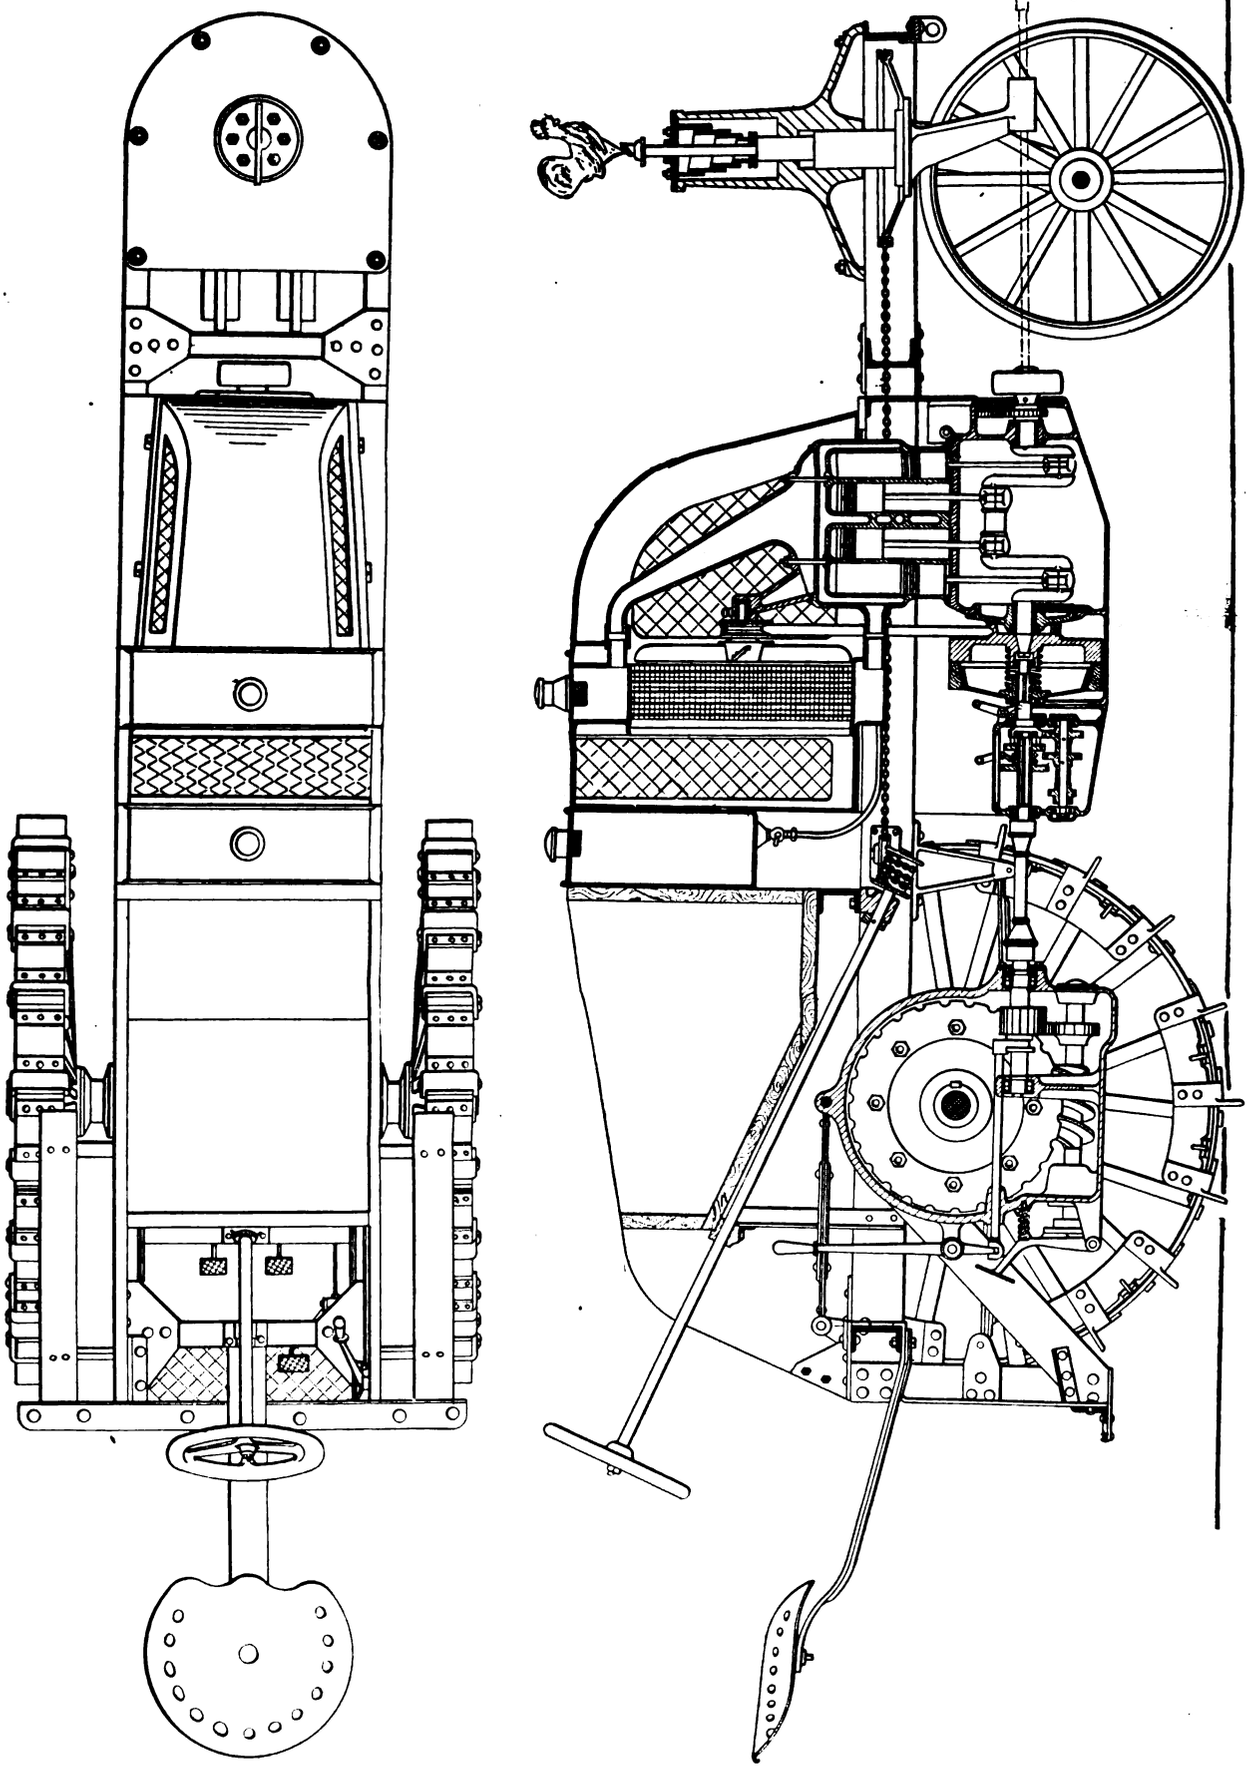
One such tractor, considered by the French Government official as a most interesting type, is the Howald-Gerster, the patents for which are held by M. Howald, with the automobile engineer S. Gerster responsible for the general design. This tractor has interested one of the leading French automobile factories and will be built by them in a short time.

Has Narrow Tread

Foreign agricultural tractors rarely take into consideration the fact that in order to work in French vineyards the overall width of the machine must not be greater than 39 inches. Also on small farms the tractor must have a short turning radius, and while designed for work in the fields it must be capable of operating on macadam and paved highways. Even French manufacturers have preferred, up to the present, to build a machine for large farms and open fields rather than for the small farms and for use between vines.

The Howald-Gerster has been designed with French vineyard conditions prominently in view. The width of the machine is 37 inches, allowing it to go between vines, which are always 39 inches apart. In a country where gasoline is costly, weight has had to be kept as low as possible, and the engine is no bigger than is necessary for the work to be done.

Mechanically the feature of the machine is independent worm drive to each of the rear wheels, it being possible to transmit the power through a differential to both wheels, or to either one or the other, as desired. By means of this feature, the machine, which has a wheelbase of 75 inches and an overall length of 130 inches, can turn in a circle of 90 inches radius, or only a little more than its own wheelbase.



The tractor is of the four-wheel type, with two main frame members solidly united by transverse members, and is driven by a four-cylinder block engine 62 by 145 mm. bore and stroke developing 10 hp. at 1000 r.p.m.

Except for its simplicity there is nothing very distinctive in the motor. It has a two-bearing crankshaft, forced feed lubrication to all parts, including the wrist pins, ignition is by high-tension, dust-proof magneto, the carbureter is a standard make, and cooling is by thermosyphon water circulation.

Radiator Back of Engine

The radiator is set back of the motor, not only to give greater accessibility, but to prevent dust being drawn in. As will be seen from the design, cooling has been well taken care of by the provision of a big head of water and straight, big-diameter inlet and outlet pipes. There is a fan in front of the radiator, the two blades of which sweep the entire cooling surface; the fan bracket is mounted on the water outlet collector, and the drive is by means of V-belt from a pulley on the crankshaft just ahead of the flywheel. An inverted cone clutch, lined with thermoid, is made use of, the clutch being independent of the flywheel.

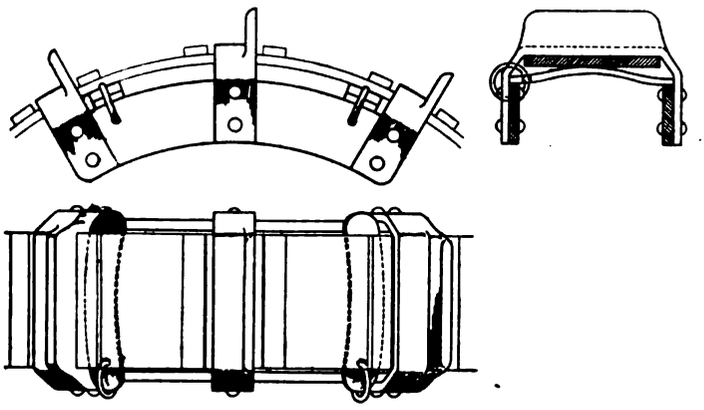
Bolted to the basechamber is a three-speed gearset within a cast-iron housing, with the drive taken by means of a short propeller shaft to the rear axle housing. A broad-faced spur pinion on the extremity of the propeller shaft meshes with two pinions slightly offset in relation one to the other, on the two underneath worm shafts. The driving pinion has a sliding motion on its shaft, and only meshes with both worm shaft pinions when in its central position. Brought fully forward or pushed fully to the rear, it engages one road wheel only, leaving the other free. By reason of this feature of the design, the machine, which has a wheelbase of 75 inches and a total length of 130 inches, can turn in a radius of 90 inches. To further facilitate turning there is an independent brake on each of the worm shafts, making it possible to lock the wheel not receiving power.

As the machine is intended for use on roads as well as over soft ground, it is spring suspended front and rear. The rear suspension consists of a pair of semi-elliptic springs passing under the axle and shackled at their forward ends to brackets immediately below the frame members; these springs provide for the torque.

The drive is transmitted through a flexible connection consisting of three or four-leaf, flat-blade springs riveted together and uniting the upper central portion of the axle housing with the transverse rear frame member. A French patent has been secured on this general layout.

Patent Detachable Lugs

Another patented feature, adopted in order to make the tractor suitable for road or field, consists of detachable strakes for the driving wheels. The rims of the wheels are fitted with ribs of sufficient depth to give adherence on a made road. The detachable strakes employed on soft ground are united together in series of three by means of curved lateral plates having the same curvature as the wheel rim. When these strakes, with their lateral plates, have been placed in position on the rim of the wheel, they are held by a couple of flat-blade springs, the center portion of each spring exerting a pressure against the inner face of the rim and the two ends dropping into notches on the side plates. No other tool than a hammer is required to dismount the strakes. When the end of the spring has been knocked out of its notch, it can be placed diagonally in relation to the strake and drawn out. This system gives ample security, while avoiding the use of bolts and nuts.

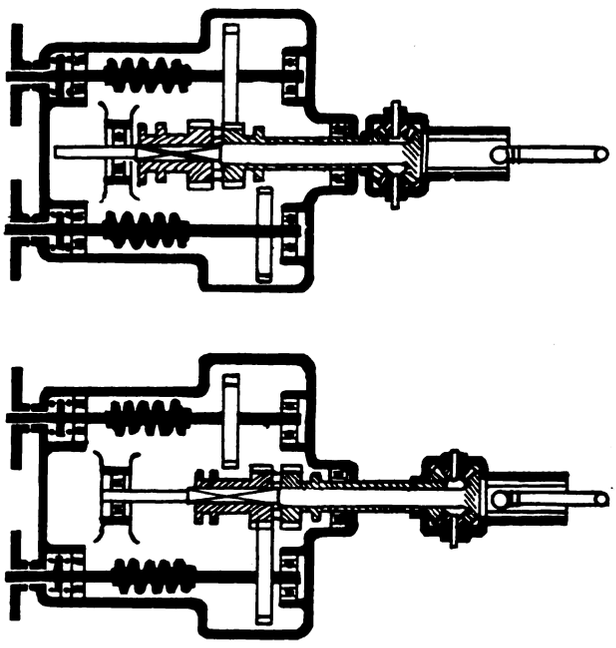


The steering wheels, which have a diameter of 23.5 inches and a rim width of 3.1 inches, are mounted on a central pivot and fork, with suspension by means of a rectangular section coil spring. The wheels are set very close together, but can be widened when desired for work on the road.

A similar system of variable track has been adopted for the driving wheels. While the minimum track is 37 inches, it can be increased to 51 inches by the interposition of couplings on the axle.

Automobile Type Steering

Steering is by means of an automobile type wheel, an inclined column and a pulley with chain, the ends of the chain being attached to the arms of the pivot and fork. The driver's seat overhangs the rear of the tractor, being sufficiently high to give him a good view ahead and at the same time to enable him to control the plow or other agricultural machine he may have in tow.



This tractor is intended to haul a two-furrow plow and to cultivate to a depth of 6 inches. The tractive effort required for this work varies from 660 to 880 pounds.

Detail of the driving lugs

On second gear, which is the one generally employed for plowing, and corresponds to a speed of 3 feet per second, or 2.05 miles per hour, the tractive effort at the drawbar is 680 pounds when plowing to a depth of 6 inches over a width of 20 inches in average earth having a density of 5.5 pounds per square inch. The required tractive effort corresponds to 3.7 hp., and, as the engine actually delivers 6 hp. at the drawbar, the margin is quite sufficient. On low gear the tractor advances at the rate of 2 feet per second, or about 1.3 miles an hour. On third gear the rate is 4.5 feet a second, or a little more than 3 miles an hour. It is intended that practically all plowing shall be done on second gear and road haulage only on third. On average ground, advancing at the rate of 3 feet per second, with a two-furrow plow covering a width of 20 inches, the surface turned over is 300 square feet per minute. During a ten hour day the machine can plow 3.8 acres of heavy ground and 5.4 acres of light ground. This estimate makes an allowance of 10 per cent for time lost in making turns, filling tanks, oiling, etc.

The tractor is handled in practically the same way as an automobile with a three-speed gearset. The only difference are two brake pedals, one for each worm shaft, and a separate lever to enable the drive to be transmitted to left or right hand wheel, or both, as desired. It is estimated that this tractor will be put on the market at an inclusive price of $1,700.

The Rumpler Two-Seater Biplane

Constructional Details of an Enemy Machine Which Has Great Climbing Power, High Speed and a Lofty Ceiling—Fitted with 250 Hp. Engine

WHAT is considered one of the fastest of German war planes is the Rumpler C-IV biplane, which, although classed as a general-purpose machine, has a high flying speed and a ceiling of 21,000 ft. The climbing capacity of this machine is also very good, being given as 5000 meters in 35 minutes (16,000 ft. in 34 minutes). To enable the occupants to breathe freely at the enormous altitudes to which this machine can climb the German Air Board has recently introduced a special form of respirator. Both the upper and the lower wings have a sweep back of 3 deg. The dihedral angle is 2 deg., and the wings are staggered forward 0.6 meter (2 ft.). Contrary to the usual German practice, the trailing edge is rigid. The ribs, which are made of three-ply wood pierced for lightness, are spaced 0.3 meter (1 ft.) apart. A uniform angle of incidence of 5 deg. is used.

Forms of Wings

The upper wings are of trapezoidal form, with rounded angles. Above the fuselage the trailing edge is cut out, as shown in the illustration. The maximum chord is 1.70 meters (5.58 ft.). Each of the upper wings has nineteen main ribs and five compression struts of tubular steel. The ailerons are tapering, their chord varying from 0.5 to 0.65 meter (20 to 24 in.).

As in so many other German machines, the lower wings have rounded wing tips. As the radius of the arc forming the rear edge is longer than that of the front, the wing tip resembles somewhat that of a propeller blade. Each of the lower wings has 17 main ribs and four steel tubular compression struts.

There are two oblique interplane struts on each side of the fuselage. The inner front struts measure 0.105 m. (4.12 in.) in section, and the rear struts 0.130 m. (5.12 in.). The outer front strut measures 0.090 m. (3.54 in.), and the outer rear strut 0.085 m. (3.35 in.). The gap between the wings is 1.85 m. (5 ft. 8 in.) and the total lifting surface is 33.5 sq. m. (360 sq. ft.), of which the upper wing is 20 sq. m. (215 sq. ft.) and the lower wing 13.5 (145).

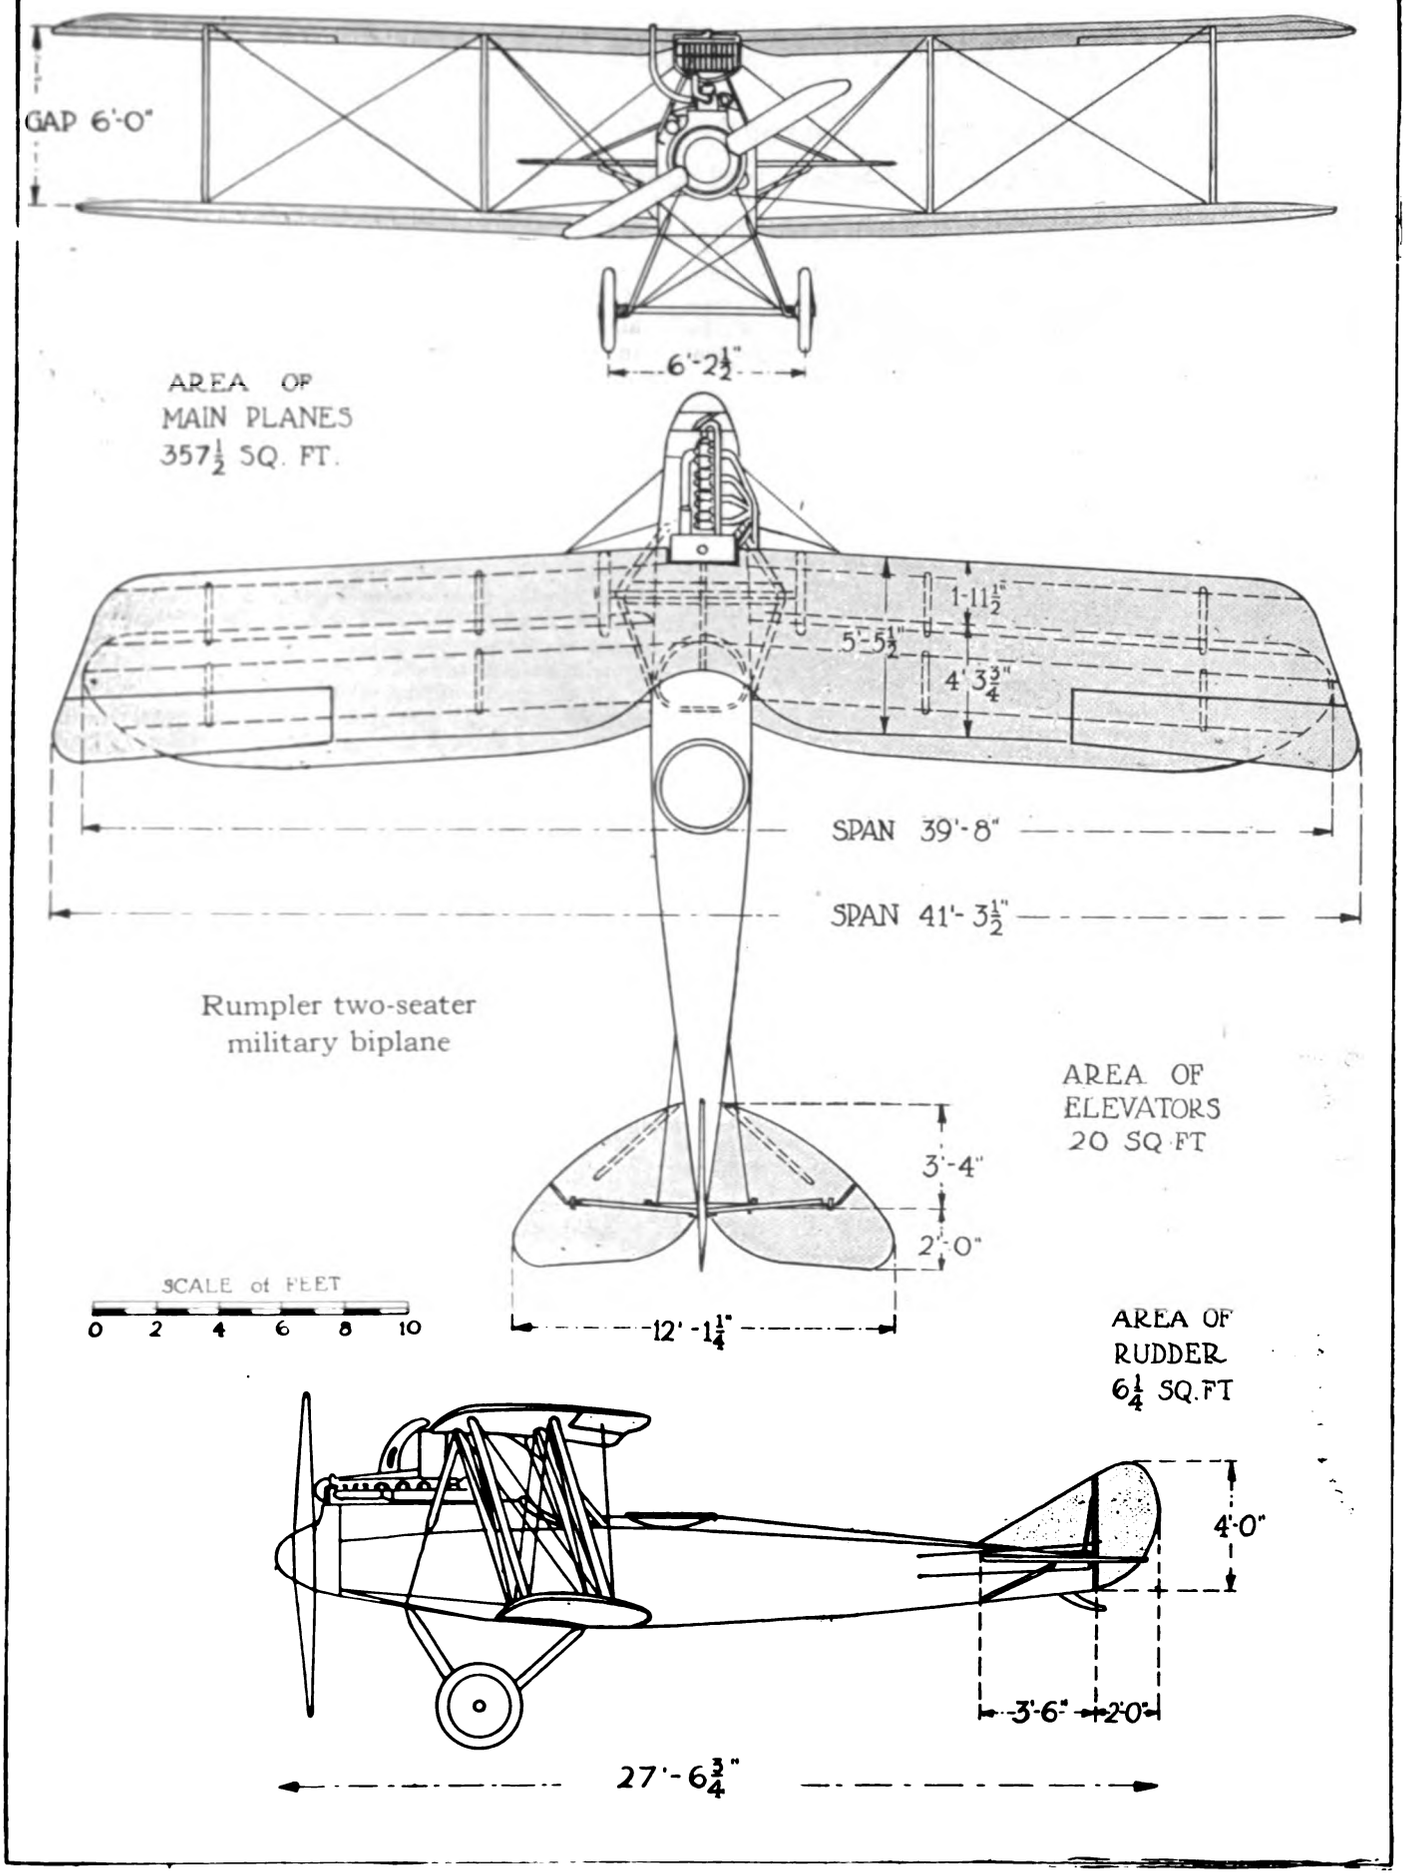
Tail Plane Bracing

The tail plane is non-adjustable, and not as deep as in previous types. Its leading edge, in plain view, is approximately a semicircle. This tail plane is supported on each side by struts attached at the other end of the bottom rail of the fuselage. Two other struts brace the tail plane to the vertical fin. The struts under the tail plane are provided with a series of sharp-edged metal points. Apparently, these serve the object of preventing the landing crew, when wheeling the machine about, from catching hold of these struts and possibly bending them. The elevator is in two parts, each of which is partly balanced by a triangular forward projection. The rudder, which is built up of metal tubes, is of the usual type, and the control cables pass inside the fuselage, being guided through small wooden tubes.

The construction of the fuselage is of the current type, with four longerons, and struts and cross members, braced by piano wire. Front and rear are covered with three-ply wood and the middle with fabric. The propeller (a Heine) has a diameter of 3.17 m. (10 ft. 5 in.). As on all other German machines, the propeller boss is enclosed in a "spinner."

The engine fitted on the Rumpler is either a 260-hp. Mercedes or a 250-hp. Maybach, both having six vertical cylinders. When the Mercedes is fitted it is slightly tilted to the right in order to allow the induction pipes to pass between the legs of the cabane. With the Maybach, which is more compact, this arrangement is not necessary. The motor is supplied with fuel from two tanks. The main one (about 58 gal.) is placed under the seat of the pilot; the second, the service tank (about 18.5 gal.) is placed at the back of the pilot, between him and the gun ring in the gunner's cockpit. The quantity of fuel carried allows of a flight of four hours' duration. The covering over the engine leaves the tops of the cylinders exposed, and incloses a Spandau machine gun operated by the motor.

The exhaust pipes run from the six cylinders to a common chimney curving upward and backward. The chimney itself is divided about half way up into three branches, probably in order to obtain a certain amount of silencing effect. As in previous models, the radiator, which is semicircular in shape, is placed on the front legs of the cabane. In front of it is a series of small slats, which can be moved so as to be either parallel to or at right angles to the direction of flight. This makes it possible for the pilot to adjust the cooling according to the altitude at which he is flying.



Behind the motor is the pilot's cockpit, and behind him again that of the gunner. Supported on a gun ring in the rear cockpit is a Parabellum machine gun. Pilot and gunner are very close together. In the gunner's cockpit there is a bomb rack of the usual type, carrying four bombs. An opening in the floor permits of taking photographs, and the machine carries a wireless set. The landing chassis is of the V type, with rubber shock absorbers. There is no brake fitted on this machine. An external drift cable runs from the nose of the fuselage to the foot of the inner front interplane strut.

—

The Motor Industry

A COPY has been received of a new book entitled The Motor Industry, its growth, its method, its prospect, and its products; with an indication of the uses to which motor vehicles of all kinds are, or could be, advantageously applied. By Horace Wyatt, B. A., published by I. M. Pitman & Sons, 2 West Forty-fifth Street, New York. The book deals briefly with the history of motor car development and discusses the factors which have influenced that development. It seems to be written chiefly for the investor and for the man who wants a general knowledge of the motor car industry, for it does not go sufficiently into mechanical details to meet the requirements of a mechanic-driver nor is it of a technical character. The book was written in England and deals with the subject from a British viewpoint, though there are numerous references to automobile development in other countries.

Specifications of Airplane Propellers

As Issued by the International Aircraft Standardization Board, Covering Materials Used, Methods of Manufacture, Inspection and Testing

ONE of the latest sheets of specifications issued by the International Aircraft Standardization Board at Washington covers the manufacture of airplane propellers. It is reprinted below.

1. The general specifications, 1G1, shall form, according to their applicability, a part of these specifications.

Materials

2. (*a*) *Wood.*—Woods used for the manufacture of propellers for motors of more than 150 hp., or more than 1600 r.p.m., are to be black walnut, true mahogany, or quarter-sawed white oak.

For machines under 150 hp. and 1600 r.p.m., will also be allowed the use of West African mahogany, cherry, and birch. In any case, the manufacturer is not allowed to use a different material from that specified in the design without permission of the purchaser.

Thickness of the boards shall be 0.75 to 1.0 in., finished.

(*b*) The laminations of the propellers being of irregular shape, imperfections are allowable on edges and parts of boards that will be cut away in the shaping of the propellers, but the stock that goes into the propeller must be straight grain, free from curls, burls, and spiral grain, without knots, checks, dry rot, shakes, dote, or other imperfections, in entire accordance with the I. A. S. B. specifications Nos. 2W3-8 for the lumber.

Sapwood is not permitted in the finished blade, and is not allowed to extend in boss more than 0.75 in. from the edge of the boss, and must in that case be sound.

(*c*) The physical properties of the wood shall be as specified in the I. A. S. B. specification No. 3W1.

(*d*) Stock shall be dried to a moisture content of 7 per cent by methods given in the I. A. S. B. specification No. 3W2.

(*e*) The *glue* used shall conform to I. A. S. B. specification No. 2V2.

(*f*) Materials used for the *sheathing* of propellers for sea planes may be the following:

(1) Sheet copper in conformity to I. A. S. B. specification 3N8.
(2) Monel metal sheet in conformity to I. A. S. B. specification 3N21.
(3) Linen in conformity to I. A. S. B. specification 2F3.
(4) Cotton fabric in conformity to I. A. S. B. specification 2F4.

(*g*) The *spar varnish* used shall conform to I. A. S. B. specification 2V1; the *filler*, to I. A. S. B. specification 2V2. The priming varnish shall be made by dilution of spar varnish with about 2 parts of turpentine.

Manufacture

3. (*a*) Each board shall be sawed and planed in accordance with blue prints. After planing they shall be glued promptly to avoid absorption of moisture, and great care must be taken to keep the wood under uniform condition of temperature and humidity during all the operations.

(*b*) Boards shall be balanced before gluing, and heavy ends alternated so as to minimize the effect of variation in the density of the material.

(*c*) The boards shall be sawed for gluing in such a way that the grain follows the lamination of the propeller, avoiding any cross grain. At the same time, the boards shall be so arranged that the grain comes out on the edge, avoiding any flat grain.

(*d*) The practice of gluing edge pieces onto the boards in order to fill out at the boss is forbidden, unless special permission is given by the purchaser. In case such permission is given, the lamination on both sides of the boss widener must be of the full width of the boss; that is, no two laminations which have wideners glued to them shall be adjacent. Both the lamination and the boss widener shall be corrugated at the joint to increase the gluing surface. No splice or "dutchman" shall be permitted on the blade of the propeller. Defective joints shall not be filled with glue. The practice of gluing a thin strip of veneer to the blades will not be allowed.

(*e*) The glue room must be kept at a temperature of 90° to 100° F. (32° to 38° C.), and an average pressure in gluing of 150 pounds per square inch (0.11kg./mm.^{2}) shall be maintained. Care shall be taken to insure an even pressure on all the parts of the glued surface for not less than 10 hours or longer, at the option of the purchaser. The pressure in the gluing process must not be removed before the expiration of 8 hours after it is completed. This period may be increased at the option of the purchaser.

(*f*) The propeller shall stand at least two days after gluing, nor shall it be finished in less than two weeks after roughing out.

(*g*) The surface of the propeller shall be smoothly sandpapered before the filler is applied, and the curvature shall be true and smooth throughout the length of the blade. Irregularities of contour are not permissible.

Tolerances

4. (*a*) Propellers shall be inspected for pitch angle, alignment, blade form, and shape of section, as soon as they are finished by the manufacturer and shall come within the following tolerance limits:

	Portion of Blades More than 50 per Cent Radius from Axis	Portion of Blades Less than 50 per Cent Radius from Axis
Alignment within	0.0625 inch	0.0625 inch.
Error in fit of templets	0.01 × width of blade.	0.02 × width of blade.
Width of blade	0.075 × width of blade	0.01 × width of blade.
Thickness of section..	0.0625 inch	0.125 inch.

For the inner half of the blade length the deviation from the specified pitch angle shall not exceed ± 1.0° at any station, and the difference between the pitch angles at corresponding stations on opposite blades must not differ by more than 1.0°. For the outer half of the blade length the average deviation shall not exceed ± 0.3°, the maximum deviation shall not exceed ± 0.5°, and the difference between corresponding opposite averages and maximum shall not exceed 0.3° and 0.5°, respectively.

(*b*) The diameter shall conform to the drawings within plus or minus 0.125 inch. The inspector may accept propellers when the diameter is 0.50 inch under specified dimensions, providing not more than 1 propeller in 10 is more than 0.125 inch under the specified diameter.

(*c*) Blades on the same propeller shall be alike within the limits given above. For example, the thickness of the blade may be 0.0625 inch greater or less than specified, but two blades on the same propeller shall not differ in thickness by more than 0.0625 inch.

(*d*) Propellers shall be inspected for alignment at the time of shipment and shall track within 0.0625 inch. If the propeller is not over 0.315 inch out of track, it is permissible to correct the alignment by scraping the wood in the boss.

5. (*a*) Before application the fabric shall be scrubbed

Digitized by Google

thoroughly with hot water and soda, and after rinsing allowed to soak in hot water for four hours in order to remove all sizing from the cloth.

(*b*) The process shall be repeated until all the sizing is removed. The cloth shall be dried and applied to the blade in the glue room, with a standard temperature of 100° F.

(*c*) The blades shall be coated evenly with glue, and the cloth applied and ironed smooth, preferably with an electric iron.

(*d*) Twenty-four hours after gluing the fabric shall be given four coats of acetate dope, followed by two coats of varnish or enamel which conforms to I. A. S. B. specifications No. 2V1.

Sheathing of Propellers with Copper or Naval Brass

6. (*a*) Metal sheathing shall be set in flush with the blade. Rivets of the same material as the sheathing shall be spaced over the area of the sheathing. They shall be applied in such a way as to fit tightly without splitting the wood and shall be applied alternately from the face and the back. The rivets shall then be headed and filed to form a smooth surface. No rivets shall be driven closer than 1 inch from the propeller edge, except at the edge of the metal or in very small blades.

(*b*) A row of rivets about 0.625 inch apart shall be spaced along the edge of the sheathing.

(*c*) The rivets shall not exceed 0.085 inch in diameter and shall show a breaking load of at least 130 pounds (58.9 kg.) at the riveted end and 180 pounds (81.5 kg.) at the head end. The working stress due to centrifugal force shall not exceed 4,266 pounds per square inch (3 kg./mm.^{2}).

(*d*) Sheathing shall be formed to the exact shape of the blade before any rivets are placed.

(*e*) The rivets shall be applied in such a way that they do not follow the line of the grain.

(*f*) When the work is complete the tip shall fit snugly against the wood. Buckling or lifting of the metal shall be considered ground for rejection.

(*g*) Sheathing shall be perforated at the extreme tip by four holes 0.0625 to 0.0938 inch in diameter, to allow the moisture to be removed.

Finishing of Propellers

7. Propellers shall be finished by the application of 1 coat filler, 2 coats priming varnish, and 3 coats of spar varnish. Each coat should be allowed sufficient time to dry before the application of the next coat.

8. (*a*) The propellers shall be tested for balance after the shaping, and after each subsequent operation which affects the balance. For this test the propeller shall be mounted so that it can turn on a horizontal axis, and the sensitiveness of the mounting must be such that it will move at the application of 1 gram (equals 0.036 ounce) at a distance of 2 feet (61 cm.) from the axis.

(*b*) The balancing shall be done in a room free from air currents.

(*c*) The propeller when completed shall stand on the balancing machine in any position without persistent motion in any direction.

9. (*a*) One propeller of each new design shall be tested by running for at least 10 hours at rated speed on the engines for which it was designed.

(*b*) A centrifugal test of at least one hour duration shall be run at a speed of 10 per cent in excess of the rated speed. This test applies to one propeller of each new or of each unconventional design and to propellers made by inexperienced builders.

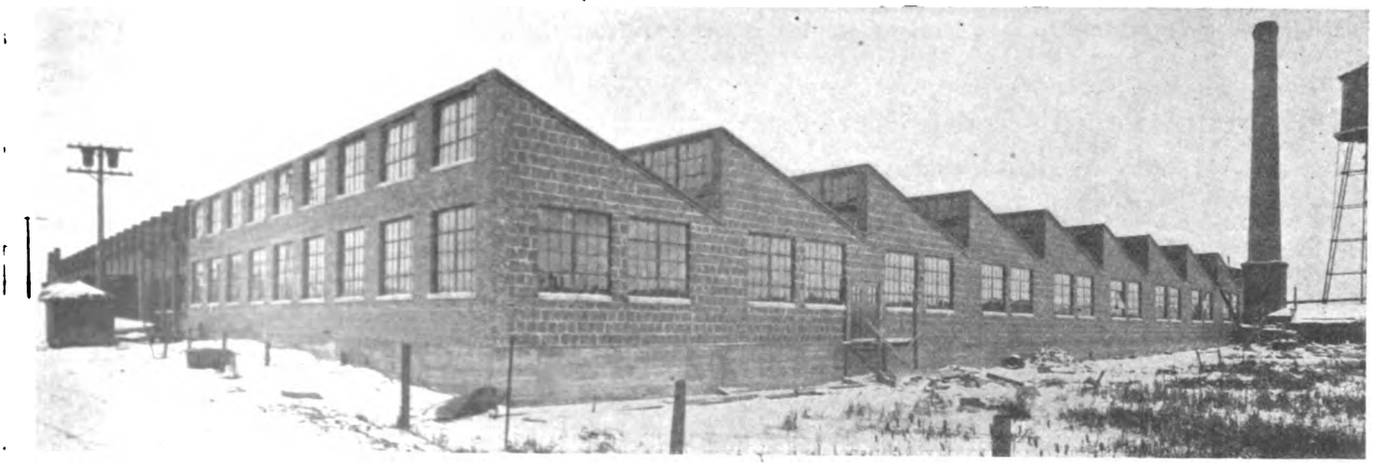
(*c*) The deflection of the tip in an axial direction shall not exceed 0.75 inch when the propeller is turning in free air at the rated speed unless greater deflection is an intended feature of the design. This requirement applies to propellers having a diameter of less than 10 feet (3.05 m.).

(*d*) Such additional tests as may be desired shall be stipulated for propellers of untried materials or of radical design, or larger than 10 feet.

Hubbing of Propellers

10. (*a*) The large boss hole shall be bored before roughing and shaping in order to insure perfect alignment.

(*b*) The fit of the hub in the large hole shall be neat and close, and the metal flange shall not show perceptible shake. The fit of the bolts in the wood shall be as tight as possible without danger of splitting the wood.



11. (*a*) The propellers shall be stamped in such a position on the boss as to be legible after the placing of the metal flange, with the following information: (1) Pitch, (2) diameter, (3) safe revolutions per minute, (4) whether right or left hand, and (5) serial number.

(*b*) On the blade shall be the manufacturer's trade-mark or name.

Addition to Berling Magneto Plant Opened

PRODUCTION has been started in the new addition to the factory of the Ericsson Mfg. Co., Buffalo, N. Y., which is shown in the accompanying photograph. This makes possible the doubling up of the former capacity. Heretofore the production facilities were limited, and made it impossible to use more than 400 or 500 employees, this necessitating day and night shifts in order to meet the demand.

The Ericsson Mfg. Co. started to manufacture the Berling magneto about seven years ago. To-day this magneto is made in one, two and four-cylinder models for motorcycles, four and six-cylinder models for automobiles and motor trucks, one, two, four, six and eight-cylinder types for marine engines, as well as six and eight-cylinder types for airplanes. The demand in the latter field, of course, is growing rapidly just now.

"Superheated Gas" Methods

By W. P. Deppé

IT IS proposed that railway congestion be relieved by the greater use of gas engine trucks, etc. But note the fundamental problems which the present use of gas engines, present methods of refining oils and crude oil production have brought into the limelight in recent months. The oil fuel problem is the only great economic problem which will grow more acute with the mere passing of time, whether the war goes on for five years or ends to-morrow.

Since 1902 gas engine use has increased more than 5000 per cent. Since 1902 the production of crude oils has increased only 600 per cent. Since 1902 the production of so-called refined motor fuels has increased about 1000 per cent.

While methods of refining oils, engine design, etc., have been somewhat improved in technical mechanical details, the method of injecting wet mixture of oil and air into engine cylinders has not been altered since the first modern four-stroke engine was used.

With present commercial fuels, made under any refining method, from one-third to one-half of each gallon of commercial gasolines is wasted so far as useful work is concerned. Besides, the sending of wet fuel mixtures into engine cylinders dilutes the lubricating oils and causes further serious waste of lubricant, damage to engine metals, etc., as openly admitted by the leading engine builders, vehicle makers, engineers in noted engineering societies, etc.

Each interest is sitting tight and passing the buck to the uninformed public, which has most liberally supported the third largest industry in America. The wonderful development of this industry to date has been unprecedented in industrial history.

Stocks of Crude Dwindling

The Bureau of Mines and the Oil Administrator call attention to rapidly dwindling stocks of crude oils in storage, yet American engine builders are turning out about 2,000,000 gas engines per year, each of which requires some wildcatter to find wells to produce 65 barrels of crude oil per year, so long as each gas engine operates, in order to permit oil refiners to produce 13 barrels of suitable fuel oil for the carbureting methods used by engine builders.

Superheated methods of carburetion permit the oil refiners to double fuel oils over night by merely dumping a barrel of kerosene into a barrel of gasoline, thus making 25 barrels of fuel oil for motors out of each 65 barrels of crudes the wildcatter must find each year for each engine turned loose on the world of industry.

Superheated gas methods permit the use of approximately 40 barrels of crudes out of each 65 found. But the engine builders feel they cannot spend tens of dollars to permit individuals buying engines to save hundreds of dollars per annum.

Prerequisites for Using Kerosene as Motor Fuel

By W. L. Dempsey

THE power of an internal combustion engine varies directly with the number of atoms of carbon, hydrogen and oxygen taken into the cylinder in proper proportions. The whole automotive industry knows only too well that there is no difficulty experienced in getting enough carbon and hydrogen into the cylinder (and into the crank case also). Any carbureter and any kind of a manifold with or without a hot spot will always supply enough fuel, especially so when kerosene is being used. The problem of successfully using kerosene as motor fuel depends upon furnishing a sufficient amount by weight and not by volume, of oxygen-bearing air, to combine with the fuel in the proper proportions. The amount of air which it is necessary to supply in addition to that taken in with the fuel is exactly equal to the reduction of the air in the gaseous charge due to the heat necessary to gasify the kerosene or other heavy oil. Until this additional weight of air is supplied, more kerosene will continue to be wasted than is transformed into foot-pounds.

Expansion Due to Heating of Charge

A pound of kerosene requires approximately fifteen pounds of air, to insure complete combustion. One cubic foot of air at standard pressure at 60 deg. F. weighs 0.08075 of a pound and, since the weight of gases varies as their density and since air expands 1/493 times its volume with every degree of heat added and every distilled hydro-carbon fuel requires a temperature greater than that at which it was distilled, in order to produce a dry gas, it will require a temperature of not less than 500 deg. to gasify kerosene, which would double the volume of the air and cut down the efficiency of the motor 50 per cent—unless provision is made in the design of the engine to force into the cylinder an amount of oxygen equal to the loss in oxygen and air of the regularly inducted charge due to the heat of gasification. This is the first and absolutely necessary step to be taken to improve the performance of kerosene motors.

Kerosene must not only be vaporized; it must be gasified by heat, at a temperature not less or equal to, but greater than that at which it was originally distilled. The sole function of a carbureter is to break up, to comminute as finely as possible, the fuel, and mechanically mix and mingle it with the air, in the proper proportions. With highly volatile fuels the velocity of the air, in the act of carburetion, together with the radiation from the motor, supplies the necessary heat, but no such temperatures as are necessary to form a dry gas from kerosene can be supplied. Therefore some method of heating, either by the hot spot or heated manifold, is indispensable.

Character of Fuel Changing

The ever increasing demand for gasoline has compelled the refiner to introduce new processes and constantly raise the temperature of distillation in order to extract the last drop possible from crude oil, so that the kerosene of commerce is not only distilled with initial temperatures of from 450 to 500 deg., but there is not left in it a single drop of the more volatile oils. It therefore becomes imperative not only that the kerosene motor shall be provided with means for adding additional air to that which is taken in with the fuel, but means must be supplied for maintaining at all speeds an air temperature of from 400 to 500 deg.

Revolving Disk for Spraying Kerosene

By R. C. Sackett

IT seems to me that, to design a satisfactory kerosene carbureter, some mechanical device must be used for vaporizing or finely dividing the kerosene spray.

Could this not be accomplished by placing in the carbureter at a point where the kerosene would drop or be sprayed onto it a very rapidly revolving small disk with a roughened surface? The result would be that this disk, rotating at a high rate of speed, would create a mist or vapor of kerosene. It would have the same effect on the dropping kerosene that an emery grinder running at a high rate of speed has upon the grinding liquid used in the automobile shops. That is, it is broken up and thrown off the wheel in a very finely divided spray.

The Draftsman, the Purchasing Agent and the Forge Shop

A Three-Cornered Combination Which Often Fails to Produce the Desired Results in the Shop

By J. Edward Schipper

IN the manufacture of machinery comprising drop forgings, the draftsman will first make his design, and then the purchasing agent will be called in to buy the forgings. Occasionally the foreman of the forging shop will be called in for consultation regarding the practicability of manufacture, but unfortunately this is not always done. Probably the chief reason for the difficulties encountered is that the draftsman quite often knows relatively little regarding forging practice. It is very rare that the draftsman has had practical shop experience in this line of work, and consequently he cannot appreciate what the forge men must know in order to satisfactorily and intelligently produce the parts desired. These points were covered very completely in a paper recently read by E. J. Frost, president of the Frost Gear & Forge Co., Jackson, Mich., before the Drop Forge Association.

Some extracts from this paper clearly illustrate the difficulties which are sure to occur when there is lack of co-operation between the draftsman and the man in the shop. It is a fact that sometimes the machining processes are entirely overlooked, either by the purchasing agent or by the draftsman, with the result that a forging which may not be expensive in first cost may come very high in the end owing to the greatly increased cost of machining.

Shop Experience Necessary

Draftsmen require a certain amount of knowledge that can only be acquired by actual experience in the shop. One point upon which they are generally weak is the necessary tolerance for drive, press, shrink and running fits. They are also weak regarding the fitting of keys, size of drill holes for rough and finished bolts, various qualities of surface desired in lathe and planer work, and hundreds of other matters which, if not shown on the drawing, must be left to the discretion of a foreman whose time should be devoted to manufacturing problems.

Efforts are being made by the Drop Forge Association to simplify a great many of these problems by standardization of fits and other details, and a tentative program has been laid out to handle situations of this nature which may arise.

One point which cannot be insisted upon too strongly is that practical drop forgers should be called in for consultation and advice when new designs are being worked out, or at least preliminary drawings or sketches should be sent to prospective sources of supply to get constructive suggestions and to avoid the revising of completed designs and details. Most drop forgers would be more than willing to render this service for their regular customers, if not for the trade at large, and in some instances the saving would be enormous.

In the case of large automobile forgings, such as axles, crankshafts, camshafts, and the like, tolerances and amounts for finish should be established within the practice of a well-organized forge shop, and it should be understood that any requirement beyond this will call for a corresponding increase in price, as will also extra-thin ribs or webs, which cool too rapidly in the dies, thus necessitating reheating or causing folds or cold shuts.

In the case of axles, the method to be employed in machining has much to do with the accuracy of forging required, and especially the relative accuracy of the various parts. The tendency during the past 2 years has been to compel the drop forger to produce an axle of such refinement that the machining cost will be brought to the lowest possible amount. This would be fair enough if the price was commensurate with the extra care and work entailed, but with a return to normal business conditions we may have a return to the old competitive methods so disastrous to peace of mind and condition of pocketbook.

It seems that an over-all tolerance of ⅛ in. should be as close as is required between knuckle-pin centers, although some axle manufacturers are demanding 1/16 in. This is hard to maintain through heat treatment, especially if the composition of the steel varies much.

An understanding should be had at the time of bidding on the work as to whether the flat surfaces on the spring pads for the U-bolt nuts are to be put in padding or are to be afterward machined.

In regard to twist in an axle, some purchasers are requiring that the yokes come absolutely to gage, but this practice is unfair unless an additional price is paid. At least 1/32 in. on the knuckle-pin centers should be allowed for distortion in this respect.

The yokes should have an allowance of from 1/16 in. to 3/32 in. on each surface for finish, plus the necessary forging draft. Restriking of the spring pads in order to conform to the curvature of the springs should be specified in drawings if wanted.

Crankshafts Have Vagaries

Coming to the crankshafts, there are such vagaries in the design that it is extremely hard to make definite statements; but, generally speaking, there should be allowed more stock on the cheeks where finished, as it is impossible to allow but 1/16 in., as is sometimes asked, and still be sure of cleaning up in machining. This is especially true of some alloy steels.

Frequently drawings show a rectangular section for that portion of a crankshaft connecting the shaft with the crank pin. This should be stopped, and the drawings should show the forging draft and also indicate finish, if required, as the forger does not know whether the draft is to be included or added. Where flanges are wanted on a crank it naturally will be necessary to have

Digitized by Google

draft produced in the hammer, and this should be considered in the design. If the flange is large, and must be made on the upsetter, side draft would not be necessary, but the expense of the extra heat should be considered.

At the Frost factory, the making of gear blanks forms a large part of the work, and these blanks are made chiefly from alloy steel. It is found that on nearly everything, from 1/16 in. to 3/32 in., finish on each surface makes for good machining conditions on turret lathes. Where it is necessary to add draft, the finish allowance at the corner is made 1/16 in., and the draft, of course, has to be machined off. In the case of wide faces this may give excessive stock, but that cannot be helped, except by the use of the upsetter.

Frequently controversies arise over the subject of countersinks for centering. Generally speaking, when the first operation on the forging is on the drill press, it is desirable to have the center in, but if it is on a turret lathe the center is objectionable and should be omitted. The customer's drawings should invariably cover this point.

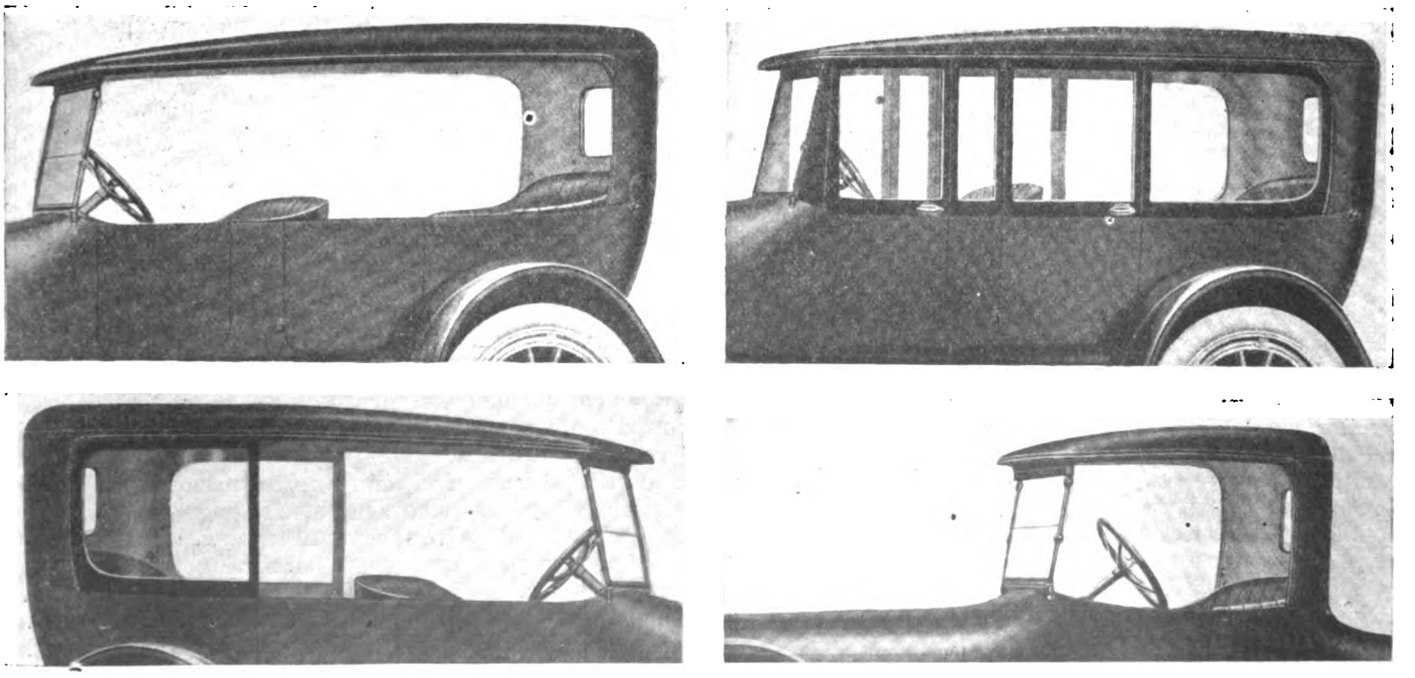
Some shops require that clutch jaws be made in the forging so as to leave a minimum of stock for machining, while others prefer to mill from the solid, as the removal of the extra stock is more than offset by the extra facility in setting up on the miller. This should be specified by the customer and should be known at the time of estimating, as it has much influence, not only on the cost of making the dies, but also on the life of the dies.

In connection with small work, there is another item that is frequently a subject for contention, and that is ends of pieces that require threading. It seems bad practice to attempt to thread rough forgings, but the fact remains that some customers require it, and in one instance a certain drop forger was compelled to make new dies because he had allowed stock for machining before threading; this in spite of the fact that the drawings did not specify the method to be used.

Where there is likely to be interference of unfinished surfaces, customers should furnish assembly drawings. In one case in point a wheel hub unfinished surface came very close to a pressed metal cap, and a better understanding of the requirements allowed the drop forger to get from 1500 to 2000 more forgings from the dies before resinking, without detriment to the product.

Rex All-Season Tops

SEVERAL styles of convertible or all-season tops have been developed by the Rex Mfg. Co. of Connersville, Ind. They include sedan, coupé and roadster types. When it is desired to prepare the car for summer use the side sections are removed bodily and thus the dead weight carried is materially reduced.



The door windows have upper glass panes held by non-rattle screw fasteners, and slide in velvet-covered channels. Rubber bumpers are provided on which both top and bottom glasses rest. With all windows removed the sides are wholly unobstructed.

The top is specially designed to harmonize with the body lines of the make of car with which it is used, though its mechanical features and general appointments are standard. The door and outer sections are held in position by attaching irons. When these are removed the holes are covered by leaving the plates in position, where they are firmly held by the cap screws.

The Rex top is built of hard wood, mitred and mortised and iron-braced. The back and the rear sections of the roof are reinforced with sheet steel. The water-proof fabric cover overlies a layer of wadding and the whole is finished for all-weather service in any specified color. The interior finish is made to match the upholstery of the car.

A special patented latch, used with the exterior coach handles, enables opening doors from both inside and outside.

WE have received from the Norman W. Henley Publishing Co., New York, a copy of a wall chart for the instruction of aviators and aviation engine repair men. The chart contains a large scale halftone cut of a six-cylinder aircraft engine partly in section, together with smaller sectional views of the carbureter and magneto. On the margin of the chart are given the different causes of trouble that may occur with an aircraft engine, the symptoms of these troubles and their remedies, together with certain other hints regarding the operation and maintenance of aircraft engines. The chart sells for 50 cents a copy.

Contracts for Class B Trucks

Complete List of All Contracts for Parts and Complete Assemblies—List Indicates Value of Standardization in War-Time Manufacture

IN the attack on the standardized war truck the statement has been made that the initial order for 10,000 trucks had never been fully placed, and that while original orders for this number had been placed some companies had refused to take such orders. Malicious rumors to this effect have been current for some time, and to set them at rest AUTOMOTIVE INDUSTRIES asked for a complete list of contracts showing the names of concerns with which contracts have been signed for the manufacture of parts entering into these 10,000 Class B trucks, as they are officially known.

The following list, which has been made public by the Quartermaster's Department, not only shows the names of those concerns that have signed contracts for manufacture of the parts, but it also contains the names of the different truck makers who have signed contracts to assemble all of these 10,000. This list should set at rest those rumors that even the contract for the 10,000 had not all been taken by assemblers, and that instead of contracts for 10,000 being placed there were only contracts placed for 7000.

Most Comprehensive List Issued

This list is one of the most comprehensive covering a line of contracts that has been made public up to this time, and is a good indication of how well scattered have been the contracts for these 10,000 war trucks. The list shows that there has not been any placing of contracts with one company in a certain line, but rather a fair spreading of them over a wide range of factories. A few examples of this follow:

Frames are being made by five different companies; radiators by eight different companies; steering gears by four companies; magnetos by three companies; motors by four companies; transmissions by four companies; clutches by three; spare assemblies by five; mufflers by four; radiator guards by five; batteries by seven; lamps by four; cape tops by four; and so through the complete gamut of parts. These contracts have been spread over a great many States; in fact, the complete scheme of contracts shows how successful has the general scheme been, and indicates the extent to which standardization can be relied upon for spreading manufacture over wide areas.

List of Contracts Under Direction of the Motors Division

Name and Location	Quantity	Item
Garford Motor Truck Co., Lima, Ohio	900	Chassis
Locomobile Co. of America, Bridgeport	1,650	Chassis
Pierce-Arrow Motor Car Co., Buffalo	2,300	1½-ton trucks
	1,000	5-ton trucks
Packard Motor Car Co., Detroit	4,800	3-ton trucks
Harley-Davidson Motor Co., Milwaukee	8,125	Motorcycles
Hendee Mfg. Co., Springfield, Mass.	5,500	Motorcycles
Mulholland Co., Dunkirk, N. Y.	500	Truck bodies, Type A
Hercules Buggy Co., Evanston, Ind.	400	Truck bodies, Type A
International Harvester Co., Chicago	1,000	Truck bodies, Type A
Theodor Kundtz Co., Cleveland	550	Truck bodies, Type A
Grand Rapids School Equipment Co., Grand Rapids	6,400	Truck bodies, Type B
Continental Car Co., Louisville, Ky.	2,000	Truck bodies, Type B
Eagle Iron Works, Auburn, N. Y.	1,200	Truck bodies, Type B
International Harvester Co., Chicago	9,000	Truck bodies, Type B
Edw. G. Budd Mfg. Co., Philadelphia	5,000	Truck bodies, Type B (steel)
J. G. Brill Co., Philadelphia	300	Truck bodies, Type B
	125	Truck bodies, Type A
Hopkins Mfg. Co., Hanover, Pa.	200	Truck bodies, Type B

	11,000	Start. crank catch brack. springs

—

IN an interview given to a representative of the *Petit Parisien*, M. D'Aubigny, Deputy President of the Inter-Ministry Civil Aeronautic Commission, stated that the project for the establishment of a postal air line between France and Great Britain was approaching realization. He considers that it would be of great usefulness, as it would enable the members of the Inter-Allied Committee at Versailles to communicate rapidly with the British Government. The plan was originally conceived some time ago and M. Flandin was entrusted with a mission to the British Government to consult with the Air Board concerning it.

Pennsylvania's War Road Example

Snow Removal Reduces Annual Maintenance

By R. H. Johnston*

Trains of motor trucks carrying an additional truck, from factory to dealer, are met on Pennsylvania's war road

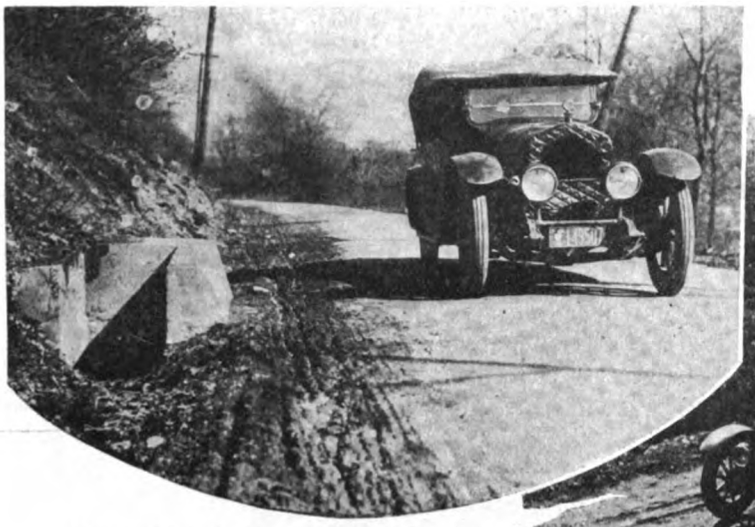
THE deficiencies of our principal systems of highways from the all-the-year-round point of view have been forcibly impressed upon me as the result of two tours of exploration I recently made with the object of determining the feasibility of driving new cars and trucks from the automobile factories of the Middle West to the Atlantic seaboard. When I say feasibility I do not mean only the possibility of driving cars and trucks through to their destination. I mean the possibility of bringing them through without subjecting them to an abnormal wear and tear prior to their delivery into the hands of purchasers. After examining the Mohawk Valley route, by way of Albany and Utica, and also the Lincoln Highway route by way of Philadelphia and Pittsburgh I must report that over neither route is it possible, at present, to bring through cars and trucks without subjecting them to greater wear than the purchaser could reasonably expect. In the case of Government trucks, I know from actual observation that almost all of these trucks which have been driven through are in need of a certain amount of overhauling before they are in a proper condition to send "over there."

With the Mohawk Valley route the obstacles are snow and ice. The State of New York, which has been so active in all the other items of the war program, has fallen down completely in the very essential one of keeping its main highways free of snow. Nothing whatever has been done by the State government in this respect. For example, the main road between Schenectady and Amsterdam has been completely blocked by ice and snow for months, and the Government trucks which have been laboriously driven to New York from Buffalo have come through only by making a detour which has involved a precarious drive on the Erie canal towpath. One day of hardship spent in the Mohawk Valley was sufficient to convince me that this route is out of the question and will be for some time to come.

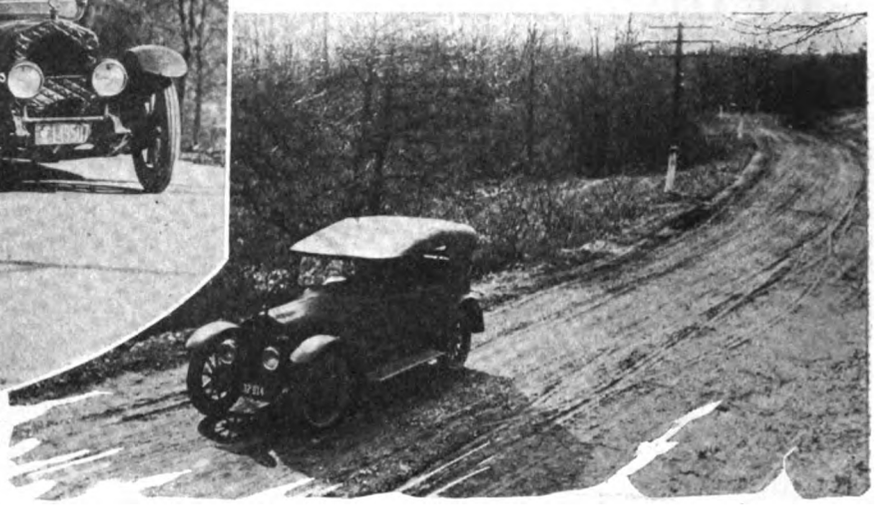
Over the Lincoln Highway route, through Pennsylvania, the difficulty is another kind. The State of Pennsylvania has kept the highway open practically all winter by using snowplows attached to motor trucks. In fact, of this route from Cleveland to New York it may be said that 90 per cent is excellent, and 7 per cent is good to fair. But the remaining 3 per cent is almost impassable, and that is about the same as saying that the Lincoln Highway, as a whole, is almost impassable.

The neglect of an 18-mile stretch of road between Beaver Falls, Pa., and New Springfield, Ohio, has practically shut off, for the time being, motor travel between the Middle West and the Atlantic seaboard over this important route. Of course, it is possible to get through this bad stretch of road, as is being demonstrated every day, but no car or truck can come through it and be in proper condition to deliver to a customer without considerable work being necessary. When we traveled over this route from New York last week, we were fully advised in Pittsburgh of the condition of this road and, accordingly, when we came to the beginning of this bad stretch, we left our car and walked ahead through the fields to inspect the road.

We found the road strewn with license plates, engine pans, tail lights, running-board fixtures and other equipment, proving only too plainly that all the cars had been running aground and that neither high power nor skillful driving was of any avail. I never saw a main road in such bad condition, and I am president of the "Mudlarks," the organization composed of those who went through the memorable New York-to-Pittsburgh endurance run in 1903. The reason the road is so much worse than the ordinary bog road is that the passage over the road of heavy Government trucks—some with 40 hp. engines, and some with four horsepower—has cut great ruts, and the weight of the trucks has pushed down into the mud all the broken stone and other solid road material. Some of the drivers, who had succeeded in coming through, estimated that there were 200 cars stuck in the mud and practically at a standstill, and others estimated the number as high as 500.



All the possible detours have been tried, and those who have tried them tell the same kind of stories as those who kept on the main road—stories of sleeping all night in cars and in farmhouses, stories of tire chains lasting only a few miles, stories of farmers with teams getting rich quick, stories of mud and cold and despair. In fact, the only method which has proved effective for getting around this bad stretch of road is that adopted by the Quartermaster's Department.



(*Continued on page* 618)

**Editor's Note.—R. H. Johnston, manager of the New York branch of the White Co., has recently driven over the highway from New York to Pittsburgh and over the New York-Buffalo route to Amsterdam, for the purpose of investigating snow conditions on these highways and the effect of snow removal from them. Mr. Johnston is well qualified to criticise modern road conditions, as he is a pioneer tourist and president of the Mudlark organization, a group of those motorists who participated in the New York-Pittsburgh endurance run of 1903. Mr. Johnston was for many years a contributor to the* AUTOMOBILE *under the nom de plume of Pathfinder.*

Rural Express Possibilities

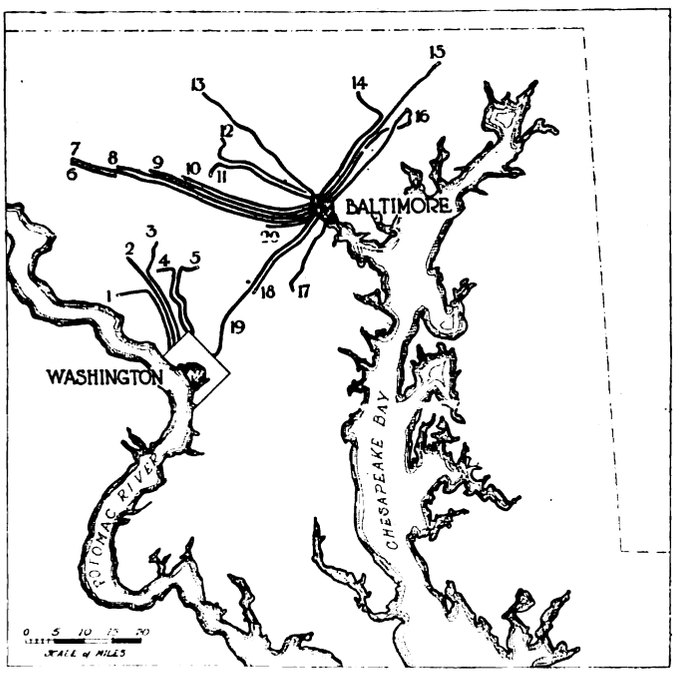
Maryland Has Twenty-Two Routes—Exclusive Franchises Granted—Department of Agriculture and Food Administration Investigate Possibilities

BALTIMORE, MD., March 20—The map on this page and the illustrations on the following page give impressions of the working of rural express systems radiating from this city and also from Washington. All told there are twenty-two different rural express routes in this area and thirty trucks are employed on these routes. The road mileage embraced on the schedules approximates 1574 miles.

In Maryland exclusive licenses are being given for the operation of rural express systems over certain routes on assurance from the applicant and truck operator that he will maintain a schedule agreed upon and further agree to provide truck capacity to take care of all the express matter offered to the system. If the applicant for the franchise cannot meet these conditions the exclusive license is withdrawn in that competing companies are given franchises over the same routes. Much criticism has been offered on this exclusive franchise basis on the ground that it may possibly be used for political purposes, which would eventually react on the development of the system. Maryland is certain to be watched closely and perhaps used as an example by other states in this rural express service.

For some unknown reason the system has developed more in this zone than in others. One explanation of this may be that there are 75,000 to 100,000 more people living in Washington, D. C., than a year ago, and yet there has not been any increase in railroad tracks to serve this influx of population. The rural express is serving to good ends in this way.

Baltimore has gained unexpected importance because of war shipping, and the fact that Newport News has not good enough highways to make it available for motor truck traffic. Baltimore has profited as a direct result of this.



The possibilities of rural express are unlimited and it largely depends on the extension of the service and the adherence to schedule. Already the service has shown what a conserver of man power on the farm it can be. The Department of Agriculture has become interested in it as a means of getting products from the farm to the city which is normally allowed to waste on the farm. It has approximately thirty-seven investigators studying the system with the thought of applying it in many other parts of the country. The Maryland system has demonstrated how it is possible to develop a business between remote farming sections and such cities as Baltimore and Washington. Farm produce and supplies are reaching these cities in a few hours, which formerly required several days, and due to which delay the volume shipped from the farms was very small compared with that handled by the express companies.

The Food Administration has already realized the value of the rural express as a means of increasing the volume of food, and also reducing the cost. It also has investigators studying the system, doubtless with the thought of urging its more general application.

As a conserver of man power the rural express has many advantages. It makes it possible for the farmer to market his food products without his having to leave the farm and neglect farm duties. There is approximately a 10 per cent shortage of help on the farms in the Baltimore and Washington zone and it is possible to an extent to compensate for this shortage of help by the rural express. It has been stated that one truck operator on a rural express system is bringing to Washington produce which was formerly brought by forty farmers. In this way man power on the farm is being conserved at approximately a 40 to 1 ratio. The rural express is also being used to carry merchandise from the city to the farm and is thus working on a return-load basis.

In northern Ohio good progress is being made and already a great many routes have been mapped out. Alert motor truck salesmen have seized the opportunity of advancing truck sales by showing the possibilities of the rural express system.

The great amount of time that is saved by rural express by motor truck as compared with horse delivery is well brought out by one example. Whereas the speed of horse-drawn wagons is but 2 m.p.h., average, trucks of light capacity, such as are used in this service, travel an average of 16 m.p.h. In other words, the truck is eight times as fast as the horse. This means, of course, that a corresponding increase in the amount of merchandise moved is effected, or that the utility of the service is proportionately increased.

Rural Delivery Routes Will Join Farmer and Market

Five horses drawing baled hay—One truck eliminated five horses from this farm. One man hauls for many farms. He has some 36 acres additional sown in wheat and corn which previously produced oats and pastured his horses

Accumulated loads—Eight gallons being transferred to milk truck; four to six hundred gallons travel rapidly to market 20 to 50 miles away. The wagon travels one-quarter of a mile back to the farm over mud road

More food made available for use—Three-gallon can of cream is $3.90 gain per day for the farmer. It will be delivered to city creamery 20 miles away in 1 hr. and 30 min. at a cost of 10 cents. A colored lad has just come down the lane from his barn 400 yd. away. In no other manner could this cream be made available at the market or the extra profit gained by the farmer

The farmer places tags on his calves and ties them in front of the house by the roadside. When the rural express truck comes along it takes the calf to market

In addition to corn being loaded into the truck there are two calves billed to market 22 miles away by Barnsley's Express—a greater profit to the farmer because of modern marketing facilities

Liberty Loan Drive

EVERY industrial organization, factory and business institution should organize a Liberty loan drive. The drive is simply a matter of salesmanship and planning from beginning to end, and hence should be handled in the same manner as a sales campaign.

In other parts of this issue directions are given which can readily be applied to any factory or business organization. The executives should not miss this opportunity to serve the government, and should immediately set to work to plan such a campaign. It is necessary to start at once if it is to be made a success, as there are a number of details in connection with such a plan that require time and thought.

Let not the idea that the matter might interfere with the regular work stop any one from organizing such a drive in his plant. The interruptions will be made up many times over by the fact that you are helping in the most potent cause which confronts us to-day. The government must have money to win this war. The Liberty loans are the only means to get it and the factories and business houses are the best medium through which to address large numbers of people collectively. Furthermore, the work will serve to engender an *esprit de corps*, a sense of participation in team work, which will fully repay the company for any loss of time.

The next drive is the most important one we have to date. The eyes of the world are on this country, and we must show our determination to win. There is no way of expressing our determination so strongly as by our willing sacrifices. Furthermore, we are not urged to give but to lend in these campaigns, and for that reason, while helping the government is the chief consideration, at the same time a habit of saving may be developed in our country whose people frequently have been accused of lack of thrift.

The U. S. A. Motorcycle

THE advantage of a single design machine for war operations, chiefly due to the simplification of the spares problem, led the Quartermaster Corps to the decision to have a special motorcycle designed for army use. The machine which has been produced (the engine of which is fully described in the leading article in this issue) does not differ materially from current stock models of the heavier type, but is probably the most advanced design ever evolved. It is essentially a side-car type, being provided with the necessary lugs for side-car attachment, and powered sufficiently to make it possible to negotiate all road conditions with the side car in place. Moderate compression is used, giving an engine which can pull hard at relatively low speed.

Protection of the working parts from dust evidently has been a problem uppermost in the minds of the engineers who worked out the design. Not only are the inlet and exhaust valve springs fully enclosed, but a special pressed steel cover has been developed for the inlet valve tappet lever, which does not interfere with oiling of the pivot bearing of this lever. To keep dust out of the engine a dust separator or air cleaner will probably be used. This may possibly somewhat reduce the engine power, but the damage done by dust getting into the engine when motorcycles are being driven in squadron formation over dusty roads is believed to be so serious that this slight sacrifice seems justified.

Sturdiness is a characteristic of the U. S. A. cycle engine and will also characterize the complete motorcycle. This is a highly desirable quality in a machine for use on the shell-torn roads of France and Flanders. The severity of the service at the front is indicated by a rumor current here last winter to the effect that one of the allied nations then had a junk pile of 70,000 motorcycles, and was considering the best means of salvaging part of this material. Even now American motorcycles of the heavier type have established for themselves a reputation of unequalled reliability at the front, and the prospects are that when the new olive drab-painted U. S. A. motorcycles arrive on the scene next fall they will give an even better account of themselves. There will be no skimping of expense for material and labor, as shown by the fact that there are no less than five annular ball bearings in the rear wheel alone.

Airplane Production

THE three airplane investigations now under way will accomplish much good if they succeed in informing the public of many of the unexpected problems that have had to be met and overcome in the development to date of the Liberty engine. The public is quite unfamiliar with the program of carrying a design such as this engine through the various steps up to production, and the difficulties to be overcome in the design of the Liberty engine were especially great because there was no aircraft engine industry in existence in this country at the time the program was decided upon.

That the production program is behind schedule is a matter of regret. There have been troubles with the Liberty aviation engine. There have been differences of opinion with regard to certain features of design right from the inception of it, but such differences of engineering opinion are bound to arise. In the development of this engine it was impossible to ride rough shod over all of the opposition. The alterations in the lubrication system of the engine to the complete force feed system might be cited as an example in point. Some of the engineers realized last June that force feed was better—in fact, essential—but the sum total of engineering knowledge to-day is greater because of some of these errors which were made to maintain co-operation in engineering circles than if such co-operation had been cut off last June. The Liberty engine of to-day is a better engine because of these problems.

These investigations, we hope, will expose to public gaze much of the pernicious pro-German activity that has been directed against this engine. Not enough publicity was given to the machinery for some of the airplane factories that arrived in ruined condition. Not enough has been said about special materials for the engines that have not been up to specifications, although there seems not the slightest reason for such delay. Too great a veil of secrecy has surrounded the engine, although this has generally been justified in that the engine occupies an entirely different field from that of almost any other piece of automotive apparatus. The airplane, serving as the eyes of the army, possesses much greater potential possibilities of destruction, directly or indirectly, than can be incorporated in a motor truck, a tank, or motor apparatus for moving artillery or other weapons of aggression or defense. It is unique in this respect, and as such greater secrecy must surround it than the other war apparatus cited.

Unfortunately, not a few of the messages that have gotten to the public have not been the most desirable, and others that should have been given circulation have not. There is no use denying the fact that some changes have been made. The engine has so much good in it that its case to-day, and the work of the Aircraft Board, would be much stronger had some of these difficulties been given a measure of circulation.

To-day it is not so much the performance of the engine but rather its speed of production that is up for investigation. The general public is not able to conceive of the amount of work necessary from the time the first design is completed until the factories are tooled up and jigged up to go into quantity production. This is an unknown story to the average mind. It is a story the meaning of which will not be fully conveyed by one telling. To put an engine of these cylinder dimensions into quantity production is a herculean task. The production of the jigs and tools alone is a big task. The time necessary becomes much greater when factories have to be built and machinery installed as well.

Co-operation Is Needed

AT a time when co-operation so far as representing the automobile industry in Washington is needed perhaps as much as at any time in these critical days the N. A. C. C. has decided not to work in the same committee with the M. & A. M. A. The dissolution of the Automobile Industries Committee by the action of the N. A. C. C. in withdrawing from it seems like a step in the wrong direction and more of a slap at co-operation than a boost for it. These are days for increased co-ordination of effort rather than reduced co-ordination.

Why should not all of the so-called automotive industries have a common representation in Washington? Such industries as automobile, motor truck, farm tractor, airplane and motorcycle have many interests in common. This is particularly true of the automobile, the truck and the farm tractor. Instead of each of these having a separate representation they should have certain joint representations. The question of fuel is common to them all. The problems of materials are much the same in all three. The same applies to railroad transportation. It is unity of effort and representation among kindred industries that should produce that war efficiency which is needed.

While co-operating together in the Automobile Industries Committee much good was accomplished and the very necessary point of contact between the industry and government department was established last November when the chrome situation was so acute. The necessary point of contact was provided through the committee during January when the coal situation was acute. The necessary point of contact was provided when the conversion work was going on. Other acute situations are bound to arise and it is difficult to see why two offices, two organizations and two avenues of approach are necessary and it is questionable if they will prove as strong as one united, harmonious presentation. These are not days for petty jealousies as to which organization is the dog and which the tail, but rather days for the strong co-operation for the general good.

Latest News of the

Committee Named to Fix Prices

To Investigate Costs of Basic Raw Materials and Recommend New Figures

WASHINGTON, March 20—A Price-fixing Committee has been appointed under the authority of the War Industries Board and will pass upon prices of basic raw materials and from time to time establish price-fixing policies for the approval of the President. The committee consists of Robert S. Brookings, Brigadier-General Palmer E. Pierce, Paymaster John Hancock of the Bureau of Supplies and Accounts of the Navy, Dr. H. A. Garfield, F. W. Taussig, chairman of the U. S. Tariff Commission, W. J. Harris, chairman of the Federal Trade Commission, Hugh Frayne of the War Industries Board, and Bernard M. Baruch. A civilian member will be appointed later.

The object of the price-fixing committee is two-fold. First, it will be a separate body, quasi-judicial in nature, for the purpose implied in its name and it will serve this purpose through being made up of men separated so completely from industrial interests that their motives and actions in the determination of prices can be subject to no suspicion of mercenary interest. Prices will not be made until after costs have been passed upon by the Federal Trade Commission. With costs as a basis, the price-fixing committee will then consider problems of production and distribution before arriving at its decisions. The second object to be achieved by the committee is speed. The committee will sit all the time and will thus eliminate unnecessary delay caused by the consideration of price-fixing problems in several different quarters.

—

Truck Brings Produce From Farm to Consumer

NEW YORK CITY, March 20—The possibility of delivering produce direct from the farm to the consumer in the city by motor truck was demonstrated yesterday when a motor truck made the trip of 180 miles from Lancaster, Pa., to New York City carrying 1000 small chickens, fifty crates of eggs, and 200 lb. of honey. The truck left at 4.25 a. m., and reaching New York City at 5 p. m., delivered the produce direct to the New York merchant.

The trip was made by John I. Blakeslee, Fourth Assistant Postmaster General, who has charge of parcel post delivery work. Mr. Blakeslee is an ardent believer in the use of motor trucks for rural parcel post delivery work and believes the high cost of living and the scarcity of help on the farm can be materially remedied by long distance service of this nature, bringing the food products from the farms direct to the centers of population without the necessity for frequent handling.

The truck will leave New York City to-day for Lancaster loaded with parcel post packages from New York to that city. The total postage charges on the truck load arriving yesterday was $31.61 and it is estimated that $10 represents the cost of the trip.

—

Ordnance Department Not to Control Truck Transportation

WASHINGTON, D. C., March 20—It may be authoritatively stated that recent plans held by the War Department to place all motor transportation of the army under the Ordnance Department have been cancelled. It now seems as if the motor truck activities will either be placed under a new division directly under the General Staff or will remain in the Quartermaster Corps, which will in that event control all of the motor transport activities of the army.

—

Stromberg Earns $318,819

CHICAGO, March 20—The Stromberg Motor Devices Co. earned net profits of $318,819 for 1917, before the deduction of war taxes. This is equal to $6.37 a share on the 50,000 shares of outstanding stock, as compared with $5.56 in 1916. Net sales totaled $1,644,947 as compared with $1,208,443 in 1916, making the net profit on sales 21 per cent as against 23 per cent the year before. The net income account of the company for 1917 follows:

Net sales		$1,644,947
Mfg. cost		1,173,890
Gross profit on sales		471,056
Administrative and general expenses		235,917
Balance		235,138
Other income		335,330
		$570,562
Loss on investments and bad accounts		16,511
Profit for year		$318,819

Kerosene Carburetor Company Is Reorganized

DETROIT, March 21—The Kerosene Equipment Co. is being organized with $50,000 to take over the Detroit Kerosene Carburetor Co. A factory will be built for the manufacture of kerosene carbureters. E. E. Schwarzkopf, president of the Detroit company, has been elected president and treasurer of the new corporation. J. W. Racklyes is vice-president.

Enlarge Washington M. A. M. A. Office

To Be Distinct from N. A. C. C. Which Also Will be Greatly Enlarged

WASHINGTON, March 20—Following the separation of the N. A. C. C. and M. A. M. A. the Motor and Accessory Manufacturers Association will occupy offices in the Ouray Building, 8th and G Streets, where it will have a considerably enlarged personnel. The National Automobile Chamber of Commerce will take over the offices previously held by the Automobile Industries Committee in the 2nd National Bank Bldg. The N. A. C. C. will have the following engineers in its organization here: C. C. Halliday, of the Lewis Spring & Axle Co.; F. H. Kane, Oakland Motor Car Co.; H. T. Woolson, Studebaker Corp.; G. L. Bixby, Anderson Electric Car Co., and C. W. Neff, of the Buick Motor Co. The men will operate under the direction of Hugh Chalmers.

—

Class "B" Convoy En Route

NEW YORK CITY, March 20—The first convoy of thirty-three of the Class B standardized war trucks started from Ohio on the trip to an Atlantic seaboard. These trucks are following the route over which the Detroit truck convoys have been traveling, and which has been kept cleared of snow through Ohio, Pennsylvania and Maryland during the past winter.

—

Withhold "A" and "AA" Contracts

WASHINGTON, D. C., March 20—Letting of contracts for the Class A and Class AA standardized trucks is temporarily withheld. The contracts will not be let until it is definitely ascertained which department and individuals will control the future of these trucks.

—

Liberty Engine in First Service

WASHINGTON, March 21—A navy flying boat equipped with a Liberty engine flew from the naval air station at Hampton Roads, Va., to the capital yesterday, covering 180 miles in 2 hours. There were a pilot and two passengers aboard, and no trouble with the engine was experienced during the trip. The return journey will be made in a few days. Secretary Daniels and other navy officials are highly satisfied with the performance of the engine, and further long-distance tests will probably be made within a few days.

Automotive Industries

Steel Trade Denies Any Shortage

Rumors of Lack of Chrome Suggest Further Curtailment —Labor is Plentiful

WASHINGTON, March 20—Washington has heard many rumors in the last week that Government officials are considering a further curtailment in the automobile industry due to an alleged shortage of steel. Again it is the chrome situation that is advanced as the reason for any further curtailments. The steel shortage is denied by the steel industry itself. It is stated here that the real reason for the curtailment by the steel shortage route is need for skilled labor of the automobile industry. Several members of the Council of National Defense admit this and have gone so far as to say the automobile industry should be curtailed another 50 per cent to provide sufficient workers for the shipyards—which is additional proof that official Washington works in circles and that one department is not all conversant with the facilities of another department. As a matter of fact there is no labor shortage in the United States anywhere that is serious. There is no shortage of shipyard workers. There is no shortage of munitions workers. There is no shortage of farm labor.

It is these three that comprise the important branches of our industrial and agricultural existence and which must have labor to insure military victory. In the New England states which are hustling and alive with industrial work of every kind including munitions manufacture and shipbuilding, and which states are regarded as an industrial barometer by the Department of Labor, there is no shortage of skilled labor and there is even a surplus in some localities.

Last week shipbuilders testified in Washington before the Wage Fixing Commission but there was no shortage of labor. This week the United States Employment Service of the Department of Labor notified all shipyards that through its usual employment channels and through its U. S. Public Reserve which has enrolled 225,000 shipyards workers, that it is now prepared to fill all their labor needs, and requests shipbuilders to obtain their workers exclusively through this service. Compliance by the shipyards with this request will eliminate labor shortage hysteria, will prevent unnecessary and permature withdrawal of workers from other industries, will abolish "stealing" of men by one yard from another, and will prohibit a piling of idle labor in the shipbuilding centers.

Insofar as munitions plants are concerned the U. S. Employment Service is ready and capable here too to provide all of the workers necessary. For example, a large munitions manufacturer in Detroit yesterday telegraphed the Department of Labor that he was in urgent need of a number of men. The Department of Labor instructed its employment service of the request and asked it to secure the labor through its usual channels adding that if this did not suffice it should draw on the Public Service Reserve branch at Detroit. This morning it was reported that the order had been filled satisfactorily. The Department of Labor now operates a weekly report system which gives an excellent indication of labor conditions. In the past week for instance, reports show that twenty-seven industrial centers east of the Mississippi felt a normal shortage of labor proportionate to the present industrial activities while eighteen centers showed no shortage or surplus and fourteen centers reported large surpluses. On the west side of the Mississippi this report is reversed and the majority of industrial centers have a large surplus of labor which displays that there is no labor shortage but there is a labor distribution problem.

The Department of Labor estimates that there will be a large demand for farm workers when the season opens. It plans to meet this demand by means of a special farm service division which will have special field agents, posters announcing federal farm labor co-operation, 55,000 post office operating as labor agencies, weekly bulletins listing opportunities for farm employment, weekly reports of farm labor conditions, co-operation of 2300 Department of Agriculture county agents, and enrollment of labor through the Public Service Reserve. In addition newspapers and other publications will open farm bureaus where men seeking farm work can register and Boards of Trade and Chambers of Commerce will operate as employment agencies. During the harvest season in the central western states temporary offices will be open in many cities to furnish accurate information as to where harvest hands are needed. A campaign is now starting to enroll 250,000 boys under 21 years in the Boys Working Reserve for farm work and another campaign will shortly begin to enroll not less than 250,000 farm workers in the U. S. Public Service Reserve. The Department of Labor states that its study has convinced it that while there will soon be a severe shortage of farm labor, there is sufficient available labor to meet the demands of agriculture and it is confident that the agencies which have been conceived and placed in operation will with co-operation meet every demand.

Pool Truck Activities of Army

Conflicting Reports Place Control of Standardized Vehicles Under Three Heads

WASHINGTON, March 20—The past week has been exceedingly active as regards matters automotive. Standardized trucks, airplane production, standardized motorcycles, and labor entered into the events of chief importance. The pooling of all motor truck activities for our army now seems to have entered into another stage. Within the last few days there have been rumors that all the motor truck activities would be pooled under the Ordnance Corps and under direction of Colonel Moody. To-day reports are current that the General Staff has decided on a new course by whcih it will pool all of the motor truck activities of the army under a civilian who will be directly responsible to the General Staff. So that now we have three reports, one that the Quartermaster Corps will control the trucks, another that the Ordnance Department will direct them, and a third that these activities will come directly under the General Staff. It is difficult to predict just which will be decided upon.

News of the completion of design and first sample engines of the new standardized Liberty motorcycle has been received with considerable interest. There have been many rumors of dissension between some of the motorcycle manufacturers on this plan which are now shown to have been false by the complete harmony with which they devoted their energies to completing this engine.

Separate War Industries Board?

WASHINGTON, March 20—The Council of National Defense seems to be gradually coming out of the muddle in which it found itself following the recent Congressional investigations. The appointment of Bernard M. Baruch as Chairman of the War Industries Board has had a stimulating effect. Reports are current that eventually the War Industries Board will separate from the council and become the only purchasing agency for the Government and for the Allies, thus bringing about that centralization of buying which the President advocated months past and which depends upon the passing of the Overman Bill. The Council itself will probably be allowed to exist as a smaller, less-important body. Such a movement would not affect the automotive section other than to increase its importance.

M. & A.M.A. Appreciates Work Done

Copland to Represent the Association in Washington—Will Continue Work Done During Life of Automobile Industries Committee—To Work with Tractor Shows

NEW YORK CITY, March 15—The Motor & Accessory Manufacturers' Assn. is going to continue its active work in Washington by way of assisting the Government in war work and also assisting its members in connection with this work. For these activities Alexander W. Copland, who was chairman of the automobile industries committee until it was dissolved, and who represented the accessory association as chairman of this committee, will continue to represent the 308 members of the association. Mr. Copland will have headquarters in the Ouray Bldg., Washington, and will be the point of contact between the various Government departments and all of the members of the association. He will continue to carry on the work that he was carrying on for these manufacturers during the life of the automobile industries committee.

Representation Continued

The Motor & Accessory Manufacturers' Assn., at its regular monthly meeting held to-day, did about the only thing left for it to do after the National Automobile Chamber of Commerce had withdrawn its representative, Hugh Chalmers, and after the Ford company had withdrawn John R. Lee, its representative, from the automobile industries committee, namely, to continue its Washington representation alone, and leave this work in charge of Mr. Copland, who has proved himself an able point of contact between the industries and the Government since the appointment of the committee last November.

Satisfactory Work Done

In taking this action, the Motor & Accessory Manufacturers' Assn. in a letter to its membership states that it considers that the work done by the automobile industries committee has been very satisfactory and that the spirit of co-operation last November as embodied in the committee was a wise move. The following closing paragraph from a letter to its membership expresses the appreciation of the association:

"Your directors cannot refrain from commending the work of the automobile industries committee, and the loyal, unselfish, patriotic and sacrificing services of the members of that committee, Messrs. Copland, Chalmers and Lee."

The association has also addressed a letter to the National Automobile Chamber of Commerce asking that body to cooperate in a letter of appreciation to the automobile industries committee for what it has done. This letter sets forth the views of the association as follows:

"We believe that the unselfish and loyal work of Messrs. Chalmers, Lee and Copland should at least be rewarded with a vote of thanks, and the directors of the Motor & Accessory Manufacturers' Assn. desire to express to the directors of the National Automobile Chamber of Commerce a willingness to cooperate with them at any time where our mutual interests are concerned.

"We believe the interests of both associations can now best be served by separate representation, although we are confident that the work of the joint committee was wise in the beginning."

A letter was also sent to the Ford Motor Co., extending the appreciation of the association for the work done by Mr. Lee as representative of the Ford company on the automobile industries committee.

The association some time ago appointed an alien labor committee, with Albert Champion as chairman, assisted by W. C. Rand and George Edmonds, which committee is ready to submit plans and suggestions for educational co-operation on the part of all members of the association. This matter is of such importance that the complete plan is to be laid before the membership at the next meeting.

The show committee of the association, under the direction of William E. Sweet, chairman, is investigating the attitude of tractor manufacturers toward the Motor & Accessory Manufacturers' Assn. with a view to assisting in tractor shows just as the association has assisted with automobile shows.

—

Plan Annapolis-Washington Highway

WASHINGTON, March 18—A bill providing for immediate construction of a concrete highway from Annapolis to Washington via Camp Parole, Chesterfield, Buena Vista and Bladensburg has been presented by Senator Mezerott. This road, if completed, will provide the remaining necessary link to connect Washington with the fertile produce regions of eastern Maryland by motor truck.

—

To Call Sub-Chasers "Eagles"

WASHINGTON, March 16—Secretary Daniels decided to-day to name the submarine fighters being manufactured by Henry Ford "Eagles." They will constitute the "Eagle class," and will be styled Eagle No. 1, Eagle No. 2, etc.

—

S. A. E. to Standardize Turnbuckles

DAYTON, OHIO, March 18—A meeting of the Society of Automotive Engineers was held at the Miami Hotel here recently to discuss the standardization of turnbuckles. It was decided that careful and prompt action be taken to adopt a uniform standard as a means of speeding up airplane production. The S. A. E. recently decided on a standard overall dimension for turnbuckles, and later complete standardization was attempted by the International Aircraft Standardization Board. When the Signal Corps endeavored to use these specifications several inconsistencies were found. As a result, the meeting of the S. A. E. was called, and work will start immediately on new standardized specifications.

Among those present at the meeting were: F. W. Caldwell and R. V. Hutchinson, of McCook Field and the Dayton-Wright company; J. V. Costello and J. L. McClelland, of the Signal Corps; F. E. Cardulla, of the Curtiss company; Paul G. Timmerman, of the Engel Aircraft Co.; G. H. Weun, Albert H. Hilton, Jr., and E. E. Russell, of the Dayton Metal Products Co.; A. M. Orr, of the National Airplane Co., and R. D. Oldfield and J. C. Wilkie, of the Western Automatic Machine Co.

Lee Tire Sales Increase—Expenses Decrease Profits

CONSHOHOCKEN, PA., March 19—The Lee Tire & Rubber Co. in its report for 1917 shows a large decrease in the balance available for dividends as compared with 1916. In 1917 this balance was $22,589, while in 1916 it was $237,337. Some of this decrease is attributed to extraordinary expenses in acquiring a sales organization and establishing branches in New York, Chicago, Boston, St. Louis, Atlanta, Indianapolis, Milwaukee, Buffalo and Providence.

The net income account and consolidated balance sheet, as of Dec. 31, 1917, compares as follows:

	1917	1916
Net sales	$4,073,895	$3,587,769
Expenses	4,015,308	3,340,863
Oper. profit	$58,587	$246,906
Income from rentals	3,102	4,163
Total profit	$61,689	$251,069
Interest and taxes	39,100	13,722
Balance for dividend	$22,589	$237,337
Dividends	.....	225,000
Surplus	$22,589	$12,337
Previous surplus	16,395	4,058
Total surplus	$38,984	$16,395

	1917	1916
Assets—		
Plant and equipment	$1,346,704	$1,206,229
Patents, etc.	403,300	400,300
Stock Lee Tire Sales Co.	500	500
Deferred charges	27,781	28,541
Cash	155,960	258,560

3 Investigations for Airplanes

Coffin Trying to Run Down Derogatory Rumors—Marshall Working with Super-War Council

WASHINGTON, March 18—Three investigations are under way to discover why the aircraft program is 90 days behind its schedule, as claimed by the Senate Military Affairs Committee.

One is being conducted by Howard E. Coffin, chairman of the aircraft board, who is determined to run down the various reports and rumors; another by H. Snowden Marshall, chairman of the committee appointed by the President, who is working with the super-war council, and a third is being made by Gutzon Borglum, New York sculptor, who has a mysterious part in the situation.

It is reported that President Wilson has already received a secret report from Mr. Borglum regarding the delayed program, which says that Borglum carried a letter from the President to airplane manufacturers and, in fact, to all concerned, to aid him in obtaining complete data.

Mr. Marshall's duties will include the investigation of the whole matter of delayed production. Mr. Coffin is working more specifically to run down reports and rumors of troubles in making the Liberty motors, which are believed in the main to be unfounded.

Mr. Coffin left Washington last Friday to make a complete tour of all the plants, and his report will be checked up later with the two others as well as those of officers of the Signal Corps whose duties include supervision of any mechanical or production irregularities which might develop.

There have been some suggestions of a profiteering ring which had enmeshed the aircraft program, but these rumors are said to be without justification. The Signal Corps and the aircraft board are both emphatic in requests that if there is any suggestion of profiteering it should be disclosed.

The most authentic reports of the Liberty motors are very optimistic. It is said that the Curtiss type of plane in which the engines have been tested are small compared with the immense battle plane now in process of construction. It is also reported that even the motors themselves which have been used for experimental purposes are relatively small, and yet experiments with these motors and planes have had results far in excess of the hopes of experts.

Liberty Airplane Arrives in Washington

WASHINGTON, March 19—The Liberty airplane engine which was shipped to Washington arrived yesterday and was tried out in a Curtiss plane under the direction of Major A. J. Smith. It is expected that many flights and tests will be made next week. Apparently there is going to be some competitive testing. Colonel Chas. F. Lee, using an Avon machine, is here, and Lieutenant Georges Flaschaire of France is en route to Washington with a high-powered French machine.

Women Working on Liberty Engines

WASHINGTON, March 19—Employment of women machinists in the factories producing Liberty airplane engines is proving satisfactory, according to the Aircraft Production Board. At present several hundred women are working on lathes, drill presses and other machines for converting rough castings into finished parts.

No More Civilian Airplane Instructors

WASHINGTON, March 18—The War Department has made a new ruling that civilian instructors will no longer be used in aviation schools and only commanding officers will do the instructing.

Form Chicago Aviation Club

CHICAGO, March 16—The Aero Club of Chicago, a new aviation association, was formed here last week. It is composed chiefly of former members of the Aero Club of Illinois, which is inactive at present. Its headquarters have not been announced yet. Officers are: President, James A. Zanug; first vice-president, Wallace B. Blood; secretary, Ralph Fulher, and treasurer, Heber Jorgenson.

Hale & Kilburn Surplus $159,961

PHILADELPHIA, March 18—The first annual report of the Hale & Kilburn Corp., successor to Hale & Kilburn Co., shows total assets of $7,374,739 and current liabilities of $1,832,512. The surplus was $159,961, as compared with $24,614 in 1916 and $1,569 in 1915. The consolidated balance sheet follows:

Assets

Plant and equipment	$12,188,331
Capital stock of Central Realty Corp.	400,000
Miscellaneous investment	10,951
Patents and good will	2,500,000
Cash	95,299
Receivables	1,167,307
Inventories of raw materials, work in process etc.	1,016,850
Total assets	$7,374,739

Liabilities

Preferred stock	$2,282,266
Common stock	1,750,000
Serial 5- to 15-year notes	750,000
Accounts payable	567,512
Notes payable	825,000
Ground rent	50,000
Miscellaneous reserve	390,000
Surplus	159,961
Total liabilities and surplus	$7,374,739

A. J. Brosseau, H. J. Fuller, Arthur Lea, Charlton Yarnall and George Foster will succeed O. H. Culter, S. M. Curwen, Thomas Newhall, A. M. Kittredge, H. W. Davis and H. D. Gibson. There is still a vacancy on the board, and Alba B. Johnson, voting trustee of the company, will nominate a director to fill it.

To Ship 1200 Planes a Month

U. S. Will Send Them to Allies in Parts—Mechanics Already There for Assembling Work

WASHINGTON, March 18—From 1200 to 1500 finished airplanes will be delivered every month to the Allies beginning Sept. 1, according to announcement made here yesterday. The planes will be shipped in parts and assembled in France or England, where mechanics have already been sent in special units for this purpose.

Recruiting for the non-flying branch of the aviation service has been temporarily suspended, as more men have volunteered than are needed at present. The progress made in aviation in this country is, according to army officials, greatly in excess of their hopes. One thousand men have been arriving daily at Kelly Field, Tex., for the past month, and additional barracks had to be constructed for them.

American-built battle planes, it is said, will be in France by July in sufficient quantities to insure adequate air protection of the sectors held by American troops. Figures on the aviation situation were placed before the full membership of the House Military Committee yesterday by Acting Secretary of War Crowell. It was disclosed that the aviation program is somewhat behind schedule, with production about 60 days delayed. Statements were made to the effect that there has been too much optimism and too many over-optimistic predictions, and if it were not for these the work of the Aircraft Production Board would already have been recognized as an extraordinary achievement.

The foreign contracts, which were to have provided the initial fighting equipment for General Pershing's air forces, were said to be still further behind the program.

Estimates of the time required to get a completed battle plane from the factory in the United States to the front in France have been placed at 90 days. The War Department is now endeavoring to cut that period in half, and this will be one of the main duties of the new committee headed by Snowden Marshall, which was announced last week.

New York S. A. E. to Meet March 28

NEW YORK, March 16—The next meeting of the Metropolitan Section of the S. A. E., to be held on March 28, will have as its topic the Steam Vehicle—Its Past, Present and Future. Papers on the subject will be read by John Sturgess, of the Stanley Motor Carriage Co., and Abner Doble, of the Doble-Detroit Steam Motors Co. The meeting will be held in the assembly room of the Automobile Club of America, Fifty-fourth Street, and will be preceded by a dinner of the section.

Tractor Men Form Organization

26 Manufacturers Meet in Chicago and Perfect Semi-Permanent Conference

CHICAGO, March 15—Twenty-six manufacturers of tractors met at the Congress Hotel yesterday and organized an "informal and voluntary" association of tractor manufacturers under the name of the National Conference of Tractor Manufacturers. The conference was called by Daniel F. Charmichiel, of the New Age Tractor Co., Minneapolis. Clifford Thorne, attorney for the Square Turn Tractor Co., Chicago, acted as secretary.

The Chicago meeting grew out of a conference of a few of the tractor manufacturers which was called to meet recently at Washington, D. C., by A. Violette, of the Wayne Tractor Co., Detroit, Mich.

A semi-permanent organization was perfected, with the direction of the affairs of the association vested in an executive committee consisting of D. F. Charmichiel, Minneapolis, chairman; F. H. Cozzens, New York, vice-chairman; W. B. Gleeson, Minneapolis, secretary; G. S. Albaugh, Chicago, treasurer, and A. Violette, Detroit.

In accordance with a resolution introduced by Albaugh, and which was passed unanimously, a Tractor War Service Committee was appointed, consisting of James R. Collins, Peoria; D. F. Charmichiel, Minneapolis; A. Violette, Detroit; W. R. Gleeson, Minneapolis; H. D. Lauson, New Holstein, Wis.; G. S. Albaugh, Chicago; F. R. Beeman, Minneapolis; F. H. Cozzens, New York; J. M. Robinson, Peoria; John Hurlbut, Detroit; D. Fitchian, Waterloo, Iowa; R. T. Evans, Hudson, Ohio, and H. W. Adams, Minneapolis.

According to Chairman Charmichiel, the purposes of the conference are to eliminate some of the unfair practices which have crept into the tractor trade, to stabilize the business of building tractors, to provide an organization in which all shall have the right to a free expression of opinion and which shall not be dominated by a single personality, to gather statistics regarding the tractor industry to be presented to the Government in substantiation of the contention that the tractor industry is an essential, and thus to win the confidence of the Government and secure a greater measure of preferential treatment.

It is hoped to secure the active cooperation of all of the tractor manufacturers in the country, all of whom will be asked to join the association, and to offer the combined efforts of the industry to the Government to work in harmony with the agricultural department and the food commission to the end that the tractor industry may be stimulated and sustained and that the food production capacities of the country may be increased.

The following companies were represented at the conference:

The Peoria Tractor Corp., Peoria, Ill.; Stinson Tractor Co., Minneapolis; Beeman Garden Tractor Co., Minneapolis; Gilson Mfg. Co., Port Washington, Wis.; Strite Tractor Co., New York; Gile Tractor & Engine Co., Ludington, Mich.

Acme Harvesting Machine Co., Peoria, Ill.; National Tractor Co., Chicago; the John Lauson Mfg. Co., New Holstein, Wis.; Interstate Tractor Co., Waterloo, Iowa; Appleton Mfg. Co., Batavia, Ill.

Common Sense Gas Tractor Co., Minneapolis; Leonard Tractor Co., Jackson, Mich.; Topp-Stewart Tractor Co., Clintonville, Wis.; Lang Tractor Co., Minneapolis; Reed Foundry & Machine Co., Kalamazoo, Mich.

Square Turn Tractor Co., Chicago; Elgin Tractor Corp., Piqua, Ohio; New Age Tractor Co., Minneapolis; Wayne Tractor Co., Detroit; Illinois Silo & Tractor Co., Bloomington, Ill.; F. C. Austin Co., Inc., Chicago; Gray Tractor Co., Inc., Minneapolis; Leader Tractor Co., Des Moines; Andrews Tractor Co., Minneapolis; Evans Mfg. Co., Hudson, Ohio.

Pierce-Arrow Earnings About $11 a Share

BUFFALO, N. Y., March 18—The Pierce-Arrow Motor Car Co. in its annual report to stockholders, to be issued in a few weeks, will show a surplus of $3,550,000, after deduction of war taxes and depreciation reserve. When allowances for an 8 per cent dividend on the $10,000,000 preferred stock are made, the earnings equal $11 a share on the 250,000 shares of common stock outstanding.

In 1916 profits were equal to $13.08, without any deduction for taxes. The balance sheet shows that current assets exceed current liabilities by $12,000,000.

—

White Company Earns $3,800,000

CLEVELAND, March 20—The White Co. earned profits of $3,800,000 in 1917, according to a preliminary report. This is after all deductions, including reserves set aside for taxes, are made, and equals $12 a share on the 320,000 shares of stock (par value $50) outstanding, or three times the present rate of dividends. The balance sheet shows current assets of nearly $15,600,000 and current liabilities of $2,600,000, leaving a working capital of $13,000,000. The White Co.'s report will be given out just prior to the annual meeting of stockholders, which is scheduled for April 8.

—

Daylight Saving Bill Passed

WASHINGTON, March 19—Congress has passed the daylight bill and it has been signed by the President. The bill is designed to save time, light and fuel. It will also supply an additional hour for home gardening by city and suburban dwellers. Clocks will be turned one hour ahead at 2 o'clock in the morning of the last Sunday in March and will be turned back one hour at the same time on the last Sunday in October.

J. I. Case Co.'s Profits Doubled

Earnings Amount to $18 a Share on Common—35 Per Cent Increase in Sales

RACINE, WIS., March 20—The J. I. Case Threshing Machine Co. shows gross sales of $17,657,753 in 1917, an increase of $4,066,854 over 1916. Net income increased from $2,658,997 in 1916 to $4,066,854 in 1917. The surplus for the year, after deducting all fixed charges, reserves, preferred dividends, etc., amounted to $1,506,273, or $18.14 a share on all outstanding common stock. This is almost double the 1916 earnings.

The net income account and balance sheet, as of Dec. 31, 1917, compare as follows:

	1917	1916
Gross sales	$17,657,753	$13,047,257
Net operating income	4,066,854	2,658,997
Interest	726,540	737,389
Depreciation	290,933	273,887
Federal taxes	275,000	.....
Contingent reserves	.....	.....
Extra charges	*417,608	.....
Balance	$2,356,773	$1,647,721
Preferred dividends	850,500	850,500
Year surplus	†$1,506,273	$797,221

*Premium on bonds bought, $143,315; and $274,293 war losses abroad.

†Equal to $18.14 a share on $8,300,000 common stock, as compared with $9.60 a share in 1916.

The balance sheet of the J. I. Case Threshing Machine Co., as of December 31, 1917, compares as follows:

Assets

	1917	1916
Property account	$11,820,915	$11,801,030
Inventories	12,814,180	9,881,337
Customers' notes	8,512,455	12,766,829
Accounts received	1,121,173	397,641
Investment in Case de France Co.	519,637	362,387
Due account prop. sold	175,000	.....
Liberty and other bonds	263,969	.....
Miscellaneous realty	182,704	202,370
European funds	1,759,997	1,281,375
Cash	*1,492,167	821,630
Deferred charges	568,597	663,266
Total	$39,230,796	$38,177,866

Liabilities

	1917	1916
Preferred stock	$12,150,000	$12,150,000
Common stock	8,300,000	8,300,000
Funded debt	6,012,000	9,000,000
Real estate mortgage	.....	.....
Bills payable	2,225,000	750,000
Accounts payable	1,332,441	1,017,625
Federal tax reserve	275,000	.....
Accrued interest, etc.	580,245	282,851
Contingency reserve	2,300,000	1,500,000
Depreciation reserve	1,298,117	1,125,670
Surplus	8,356,109	4,051,719
Total	$39,230,796	$38,177,866

*Includes $497,000 deposited with trustee under terms of trust deed.

Foreign trade showed a marked increase, most of the orders coming from the allied governments, subject to cash payment in this country.

Wave of Prosperity in Cleveland

War Industries in Full Swing—Exceedingly Productive Season Reported

CLEVELAND, March 19—Cleveland is experiencing a wave of business prosperity, as its war industries are organizing themselves into full swing and its commercial business barometer is rising rapidly. A large group of automobile, truck and parts manufacturers are located in Cleveland and without exception they report an exceedingly productive season.

The White Co. is utilizing only a small part of its productive facilities for passenger car work. The demand is comparatively small for a car of this price, but truck business is especially good. The company is busy with war truck production. Little of this is United States war business, due to the fact that the company is heavily involved in transacting business with the Allies, particularly France. It is making, however, some trucks for the United States.

Malleable Putting Up Plant

The National Malleable Castings Co. is putting up a large new plant and within 30 days will be in production here. The old plant will be continued due to the great amount of orders, most of which are of war contracts. Castings for barrels of trench mortar shells and also small castings for hand grenades are being turned out in large quantities by the company.

The Willard Storage Battery Co. is producing about 60,000 batteries a month. This is slightly less than a year ago, on account of reduced passenger car production. Nevertheless, the decrease is relatively small because of increased sales by dealers throughout the country. The business is gaining rapidly, and if the present increases continue, it will soon be on the same basis as a year ago, according to reports.

The Chandler Co. is well under way with its large tractor building, as was reported recently in AUTOMOTIVE INDUSTRIES. It is believed that this business will not be in full swing for 2 or 3 years, although production may start about August.

Martin Corp. Building

A large plant is being erected for the Glen Martin Aircraft Corp., which, it is expected, will be one of the leading aircraft companies in the vicinity of Cleveland. A great interest is taken in the matter by citizens of Cleveland, who aspire to have Cleveland known as an airplane manufacturing center.

The Jordan Motor Car Co. is doing good business throughout the entire country, particularly in the South, where express shipments are being made whenever it is possible to get express equipment. This, fortunately, has been possible during the last few weeks, although predictions are that it will become increasingly difficult to obtain this. The production aimed at is about 50 a week by April. Cars are being driven overland to Chicago and points in the Middle West. It is impossible to drive South, but express shipments heretofore have taken care of deliveries to this part of the country. Jordan has 153 orders on hand for immediate delivery.

—

Winton Prices Increased

CLEVELAND, March 18—The Winton Co. has increased the factory prices of its 33-hp. cars $200 and its 48-hp. cars $350. The new prices compare as follows:

Model 33 hp.	Old Price	New Price	Increase
Roadster	$2950	$3,150	$200
Cloverleaf	2,950	3,150	200
Touring car, 4- and 5-pass.	2,950	3,150	200
Touring car, 6- and 7-pass.	3,000	3,200	200
Coupelet	3,265	3,465	200
7-pass. touring, with permanent top	3,600	3,800	200
4-door convertible sedan	4,000	4,200	200
Limousine	4,200	4,400	200
48 hp.			
Roadster	$3,500	$3,850	$350
Cloverleaf	3,500	3,850	350
Touring car, 4-, 5-, 6- and 7-pass.	3,500	3,850	350
Limousine	4,500	4,850	350
Sedan	4,750	5,100	350
Limousine landaulet	4,750	5,100	350

—

Marmon Prices Increased

INDIANAPOLIS, March 19—Factory prices of open models of Marmon cars were advanced $200 yesterday. The prices are:

Model	Old Price	New Price
7-Pass. Touring Car	$3550	$3750
4-Pass. Roadster	3550	3750
5-Pass. Touring	3500	3700
Chassis with cowl	3250	3450

There has been no change in the price of the closed cars.

—

Price of Grant 6-Passenger Raised

CLEVELAND, March 19—The Grant Motor Car Co. has advanced the price of its 6-passenger models from $1,055 to $1,095, an increase of $40.

—

Studebaker Commercial Cars Higher

DETROIT, March 20—Prices of all Studebaker commercial cars have been increased $100. The advanced cost of materials and increased manufacturing charges are assigned as reasons.

New prices of the Studebaker commercial cars follow:

Model	Old Price	New Price
½-Ton		
Panel delivery	$985	$1085
Express	980	1080
Station wagon	985	1085
Chassis	945	1045
1-Ton.		
Stake body	1450	1550
Express	1400	1500
16-Pass. bus	1600	1700
Hearse chassis	1500	1600
Chassis	1300	1400

Increasing Business for Detroit

Manufacturers Reorganizing Traffic Bureaus to Cope with Freight Situation

DETROIT, March 20—Manufacturers in this city and the surrounding territory report good business development. Although the freight situation is relieved to some extent, it is by no means back to normal. Most manufacturers, however, have had less difficulty in shipping cars during the last few weeks. The percentage of drive-aways is increasing from day to day, and many manufacturers are increasing their production.

Traffic departments have been reorganized to cope with the new situation. If the old methods were practised at this time the number of freight cars obtained would be even less than the number procurable now. Some companies have crews continually scouring sidings for empties. The minute they see a car being unloaded they make arrangements to obtain it for their company and usually these cars are loaded with automobiles without being moved.

Despite mild weather and heavy rains, which have made the roads troublesome to drivers, dealers are begging to drive away cars. One dealer came from Kansas with five women and a man to drive cars from the Briscoe plant.

The Maxwell company has adopted a new plan, which makes it possible for one man to drive two cars. The company has found that sending out 10 cars with 5 drivers is most satisfactory. Each car trails another.

The Federal Motor Truck Co. states that the East is waking up to the use of the truck and good business is reported in that section. During the Boston show the company sold more than one truck a day.

—

A. A. A. Changes 2 Committee Heads

NEW YORK, March 20—Clifford Ireland has been appointed chairman of the Legislative Committee of the American Automobile Association, succeeding O. I. Yellott, who has resigned. Mr. Ireland has been head of the Touring Board and his place there has been taken by Carl G. Fisher.

—

No Vote of Confidence

In a news item appearing in AUTOMOTIVE INDUSTRIES of Feb. 21 relative a meeting of the National Automobile Chamber of Commerce and the Motor and Accessory Manufacturers Assn. on Feb. 14 there is a misstatement. This item says: "A unanimous vote of confidence was given Christian Girl for the manner in which he is carrying on his work."

No vote of confidence was asked and no vote of confidence was given.

Urge Widest Possible Use of Trucks

Council of National Defense Asks Help of States—Centralized Highway Control Essential

WASHINGTON, D. C., March 19—The first Government expression concerning the broader use of motor trucks and building roads suitable for them has come from the Council of National Defense, which states that it favors the widest possible use of motor trucks for highway transportation as well as the removal of regulations restricting and discouraging the present use of highways for this purpose. The statement issued by the Council of National Defense is:

"The Council of National Defense approves the widest possible use of the motor truck as a transportation agency, and requests the State Councils of Defense and other State authorities to take all necessary steps to facilitate such means of transportation, removing any regulations that tend to restrict and discourage such use."

Depression in Road Building

Since Nov. 1, 1917, when Priority Order No. 2 was issued through the Council of National Defense, prohibiting the use of open-top railroad cars for the transportation of road-building materials, the road-building movement in general has been under a cloud of depression, and this is the first broad ray of sunshine that has come. The Quartermaster's Department by driving overland war trucks from Detroit and Buffalo to the number of nearly 500 has demonstrated the super-essential characteristic of highways in war times. The development of the rural express systems in Maryland has brought to the attention of the Government the factor that good highways constitute by preventing the waste of farm products due to getting them to the city not only quicker, but where it is impossible without motor apparatus. The return-load movement in Connecticut has constituted another chapter in the super-essential characteristic of roads in war time. The snow-removal work of Pennsylvania has demonstrated how road-maintenance cost is reduced by snow removal and how mountain highways are converted into useful channels of transportation during winter months when the carrying capacity of railroads is off and when the carrying capacity of highways is needed.

At present the highway situation of the nation, so far as appropriations is concerned, rests almost entirely in the hands of W. G. McAdoo in that he occupies the dual position of Secretary of the Treasury and Director of Railroads. As Secretary of the Treasury he has complete control of every appropriation made for highways. These appropriations are passed upon by what is known as the Capital Issues Committee, which must approve of every bond issue of $100,000 or over for highway construction. Through his position as railroad dictator Secretary McAdoo entirely controls the transportation of road-building materials. As soon as he took charge of the railroads Priority Order No. 2, prohibiting the shipment of road-building materials in open-top railroad cars, was rescinded.

Centralized Authority Essential

What is really needed in Washington today is some centralized authority on highways. While Secretary McAdoo holds the key to the situation he should have some representative or some committee which would constitute a centralized authority on everything relating to the highways. There are many activities for such a centralized committee.

There is the attitude toward transportation of road material which generally must be carried on railroad cars.

There is the necessity of the nation deciding on what constitutes a suitable road for modern highway traffic.

There is the necessity for such a centralized committee that would have authority to state what constitutes a permissible load to be carried on highways.

There is the necessity for such a centralized committee to decide if Federal registration of motor trucks would not be desirable, in fact almost necessary under the new system of highway transportation.

Must Decide Maintenance Percentage

There is the necessity for such a centralized committee to determine what percentage of highway maintenance should be paid by the users of highways and what should come out of the general fund. At present there seems to be no consensus of opinion on this subject and the different States are constituting laws unto themselves in this respect. An example is Maryland, which charges $342 per year registration tax on a 5-ton truck and has a bill before its legislature to double this tax. The State further threatens to again double this tax at a meeting of its legislature 2 years hence, at which time the tax would be four times what it is at present

There is the necessity for such a centralized committee which would define exactly what is an essential, commercial, and military highway under war conditions.

There is the necessity for such a centralized committee to consider the question of snow removal in its broader sense and perhaps recommend what highways must be kept clear of snow during winter months for commercial and military reasons.

There is the necessity for such a centralized committee to determine what appropriation the Federal Government should make for the maintenance of those highways over which its transportation is passing. Great Britain has already found it necessary to make appropriations to local authorities for wear and tear on their highways due to war traffic by motor truck. Different States in the U. S. A. are faced with the same problem today.

There is the necessity for such a centralized committee to determine the carrying capacity of bridges on main highways of military and commercial value. At present some bridges in New York State are not strong enough to carry 5-ton loads of war trucks, and the transportation of supplies for our army in France is being delayed because of this. The problem has already become one of Federal importance more than merely a matter of State importance or importance to some local community in a State.

That there is the necessity for such a centralized committee is indisputably demonstrated by the troubles on the Lincoln Highway on the boundary between Pennsylvania and Ohio, where there is a short linkage of unimproved highway, making it necessary to load the Government war trucks which are being driven from Detroit to Baltimore onto railroad cars to get them over this short stretch.

New York Refused to Remove Snow

That there is the necessity for such a centralized committee is further indisputably demonstrated by the fact that New York State refused to remove the snow from the Buffalo-Albany route, and as a direct result of this motor truck trains from Buffalo to seaport were 8 to 10 days longer making the trip than they should have been, while at the same time General Pershing was sending urgent cables for these very trucks. While in war it is no time to leave it to the whims of a State whether it will remove snow from its highways or not when the issues of a nation are at stake.

That there is necessity for such a centralized committee is further demonstrated by the hopeless lack of co-ordination among highway systems, inland waterway systems, railway systems, trolley systems, and others on which falls the burden of a nation's transportation.

—

Changes on Boston Motor Row

BOSTON, March 19—There have been several changes on Boston's Motor Row in the last few weeks. The Shauk & MacMurray Co. has been taken over by the Utterback, Gleason Co., Dort distributer, and has dropped the Columbia car. The Hawley-Cowan Co., Saxon distributer, has been dissolved and its salesrooms rented by the Republic Truck Co. The Hinchcliffe Motor Co., handling the Jordan, has dropped the Kissel line,

Digitized by Google

which has not been placed yet. J. H. MacAlman, who handles the Stearns, has added the Liberty, and C. I. Crowell, who headed the Liberty agency, will be associated with him. George Dunham has resigned from the Stearns forces and taken the agency for the Standard eight. The Apperson Motor Co. has been formed to handle that line, and the Murray eight, formerly handled by the McCarthy-Meyer Co., has been taken on by George Leghorn, of the Hupmobile company.

—

66,545 Cars and Trucks in Western Canada

WINNIPEG, MAN., March 18—Official figures show that 66,545 motor vehicles were licensed in Manitoba, Alberta and Saskatchewan during 1917. This is an increase of 29,727 or 80 per cent over 1916. The greatest gains were made in Saskatchewan, where 33,562 motor vehicles were licensed last year, as compared with 15,654 in 1916. Alberta registrations jumped from 9,211 in 1916 to 16,000 in 1917, and Manitoba figures show total registrations of 17,393 last year as compared with 11,393 during the previous year.

—

Goodrich Company Changes

AKRON, March 16—At the annual meeting of the B. F. Goodrich Co. the retirement of $900,000 of the preferred stock, already authorized by the directors, was authorized by the stockholders. The old officers were re-elected, with the following additions as vice-presidents, H. K. Raymond, W. Rutherford, W. C. Geer and A. B. Jones. Waddill Catchings of Goldman, Sachs & Co., and F. C. Van Cleef were elected directors, succeeding Henry Goldman and F. A. Harding. At the meeting of directors, which followed the annual meeting, H. C. Miller was appointed manager of the tire sales department.

Detroit Leading in War Work

Has $500,000,000 Contracts for Government Trucks—Cleveland Second with Half the Amount

DETROIT, March 19—Detroit has received more than twice as many Government contracts for manufacturing, assembling and equipping motor trucks as any other city in the United States. Orders accepted by 50 manufacturers here aggregate $500,000,000. Cleveland is a weak second, with about $200,000,000 in contracts.

Contracts awarded to Detroit companies represent only part of the war work that is being done in the State of Michigan, as Grand Rapids, Flint, Lansing and many other cities are doing an immense amount of Government work.

Among the Detroit companies to whom contracts have been awarded are: Packard Motor Car Co., 1, 1½ and 5-ton trucks; Continental Motors Corp., Class B motors; Hinkley Motors Corp., Class B motors; Timken-Detroit Axle Co., Class B worm axles; Detroit Gear & Machine Co., clutches; Gemmer Mfg. Co., steering gears; McCord Mfg. Co., National Can Co., Long Mfg. Co., radiators; Detroit Pressed Steel Co., frames; Detroit Steel Products Co., springs; Michigan Malleable Iron Co., steel wheels; Hayes Mfg. Co. and C. R. Wilson Body Co., seat assemblies; Michigan Stamping Co. and International Metal Stamping Co., dashes; Hayes Mfg. Co., hoods, fenders, fan shrouds; Michigan Stamping Co., fan shrouds; Detroit Battery Co., batteries; Edmunds & Jones Corp., lamps; Schweppe & Wilt Mfg. Co. and Detroit Pressed Steel Co., reach rods and spray assemblies; Zenith Carbureter Co., carbureters; Michigan Stamp Co., bumpers; Oldberg Mfg. Co., mufflers; Gemco Mfg. Co., mufflers; National Machine Products Co., rear springs, shackle hub assemblies; Massnick Mfg. Co., parts for steering gears; National Machine Products Co., steering gears; Standard Brass Works, radiator parts; Burton Lowery Co., J. C. Wilson Co., Briggs Mfg. Co. and American Auto Trimming Co., upholstery, and Barey-Nicholson Co., wiring assemblies.

—

Detroit Center of Munitions Zone

DETROIT, March 18—Detroit will be the headquarters for one of the munition districts recently designated by the United States Government. The new plan is one of the results of the reorganization of the ordnance department a few months ago. Besides bringing the department into direct association with the industries, so that the work of turning out war materials may be followed up more closely, it also assures quicker payment for work done, better inspection facilities and more accurate information as to progress of the work.

Heretofore manufacturers and their representatives who went to Washington to obtain war orders lost time waiting for appointments with those in charge of the various departments. This will all be eliminated by the establishment of a central clearing house in Detroit.

Fred J. Robinson, of Lowrie & Robinson Lumber Co., and a member of the Detroit Board of Commerce, has been made chief of the Detroit zone.

The action of the Government in establishing a clearing house in Detroit for the ordnance department is in accordance with the efforts made by the Detroit Board of Commerce.

Men of the Industry

Changes in Personnel and Position

Colt Elected Chairman of U. S. Rubber Directorate

NEW BRUNSWICK, N. J., March 20—Samuel P. Colt, president of the United States Rubber Co., was elected chairman of the Board of Directors at the annual meeting of stockholders held yesterday. Samuel Myers, Ernest Hopkinson and J. Newton Gunn were elected directors. Gunn is president of the United States Tire Co.

—

Walter Campbell has been appointed assistant supervisor of materials at the Harroun Motors Corp., Wayne, Mich. He was formerly with the Hupp Motor Car Corp.

—

C. E. Lindsey, formerly manager of the Windsor branch of the Swedish Crucible Steel Co., Detroit, has been promoted to the position of sales manager.

—

R. C. Bridge, who has been associated with the Willard Storage Battery Co. on the Pacific Coast, has been appointed manager of the San Francisco district. He will have headquarters at 1380 Bush Street, San Francisco.

—

C. S. Harper, formerly district manager for the Willard Storage Battery Co. at San Francisco, will operate the Willard service station at Seattle.

—

Frank A. Kapp has become associated with the Associated Blue Book Publishing Co., New York. He was formerly advertising manager of the Mitchell Motors Co., Racine.

—

William P. Barnhart has been made assistant sales director of the United States Motor Truck Co., Cincinnati. He will have headquarters in Washington, where he will handle the business of the Stewart Iron Works and the United States Motor Truck Co.

—

W. F. Thompson has been appointed engineer of J. C. Widman & Co., Detroit, a furniture manufacturing corporation, which is engaging in airplane work.

—

L. R. Johnson, for the past 3 years auditor of the Jones Motor Car Co., Wichita, Kan., has been elected treasurer of the company.

—

Crosby White, formerly associated with A. J. Picard & Co., has been appointed traveling sales manager of J. H. Faw, Inc., New York.

Benjamin S. Rosenberg has been appointed manager of the New York office of the United Smelting & Aluminum Co., Inc., New Haven. He was formerly connected with Post Van der Burg & Co.

—

E. L. Lick has resigned as assistant manager of the car order department of the Willys-Overland Co. to become manager of the car order department of the Simons Sales Co., Toledo.

—

J. H. Teagan has been appointed export manager of the Hupp Motor Car Corp., Detroit, to succeed Charles Denby, who has entered government service. Teagan was formerly Denby's assistant.

—

O. S. Tweedy, manager of general branch sales of the U. S. Tire Co., has resigned, and has been elected vice-president of L. A. Young Industries, Inc., Detroit. He will leave the U. S. Tire Co. on April 15, and start active work in Detroit May. 1.

—

Liberty Engine Under Test

WASHINGTON, D. C., March 20—It is stated here that a 50-hr. test is being made of a Liberty airplane engine at Camp Bertner, Lake Charles, La., and officials of the Aircraft Production Board and the Aviation Section of the Signal Corps are awaiting results. It is expected that several trials and tests will be made here within the next two weeks of the Liberty airplane engine which arrived here a few days ago and is in a Curtiss plane.

—

Earning Power of Truck Service

NEW YORK CITY, March 20—An example of the earning possibilities of a motor truck in the parcel post rural delivery service was given at the annual dinner of the Motor Truck Club in this city last night by James I. Blakeslee, Fourth Assistant Postmaster General, of Washington. He has charge of this work, and looks to the time when there will be parcel post motor service over practically all the roads of America.

On a parcel post route from Philadelphia to Oxford, Pa., a round trip of 110 miles, a 1½-ton truck had made this trip every day all winter without a single exception. Mushroom growers at Oxford are shipping 1½ tons of mushrooms to Philadelphia each day. In the first 3 days the truck earned $30 per day charging parcel post rates for the work. This truck, in this service, can earn $12,000 a year and the service cost for this will be $4,200 a year.

Previous to starting this truck route, the mushrooms were shipped by railroad from Oxford to Philadelphia, a distance of 120 miles, whereas by motor truck the distance is only 55 miles.

Mr. Blakeslee cited many other examples to show that the earning powers of the motor truck in parcel post service, where it also carries first class mail, is so great that there is no question but that the entire service will be motorized as quickly as appropriations can be secured.

New Companies Formed

Latest additions to ranks of Automotive Industries

L. A. Young Interests Made Into One Company

DETROIT, March 20—L. A. Young Industries, Inc., has been formed to consolidate the interests in which L. A. Young, of Michigan, has been interested. The Detroit Wire Spring Co. will be the nucleus of the company, according to O. S. Tweedy, vice-president of the corporation. Other companies will also be consolidated but the names will not be announced until stock arrangements have been completed.

—

Ross Company to Make Trucks

SAGINAW, MICH., March 19—A new organization, to be styled Nelson B. Ross Motor Truck Co., has been formed in Saginaw. The firm is capitalized at $300,000 and will make heavy trucks. The paid-in capital is $175,000.

—

Furniture Company Making Truck Bodies

NORTHVILLE, MICH., March 19—The Globe Furniture Co. of Northville is now producing truck bodies, mostly of the stake type. The production averages 3 bodies a day.

—

Government Would Standardize Screw Threads

WASHINGTON, March 18—A bill was introduced in the House a short time ago providing for the appointment of a commission for the standardization of screw threads. It is provided that the commission shall consist of seven members to be appointed by the Secretary of War (one, a commissioned army officer), by the Secretary of the Navy (one, a commissioned naval officer) and by the Secretary of Commerce (five, of which one shall be the director of the Bureau of Standards, two from nominations made by the S. A. E. and two from nominations made by the A. S. M. E.)

The commission is to serve without pay and establish certain screw standards, which are to be submitted to the Secretaries of the Army, Navy and Commerce, and if approved by them shall be put in use in all plants controlled by the Army and Navy and, so far as practicable shall be used in all manufactured articles ordered by these departments. Hearings on the bill, which was introduced by Mr. Tilson, were given before the Committee on Coinage, Weight and Measures on March 5 and 7. The idea is to formulate complete screw standards with different tolerances. The bill, it was said, is chiefly a war measure.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Steel Production Made Rapid Stride Last Week

Steel production with some companies has made a considerable stride forward in the past week, Steel Corporation plants apparently coming closer to normal capacity than the majority of independent producers. A 10 per cent increase over the February rate represents the average condition. The situation as to cars and motive power is still a serious one and promises to continue so.

Iron and steel manufacturers entered the price conference with the War Industries Board at Washington Wednesday knowing that they would be asked to make reductions on some products, particularly pig iron. Producers of foundry iron strongly oppose lower prices, and a compromise may be made by reducing basic iron $1, or to $32, and Bessemer iron, which is 10 per cent higher, from $36.30 to $35.20. There is a probability, too, of some downward revision in scrap, in certain forms of which competition has already brought reductions from the Government basis.

On some finished products which have been considered out of line the Government will also seek reductions. How strongly these will be pressed depends upon the extent to which Washington considers the output of smaller high-cost plants to be essential to the carrying out of its program. On the score of securing the largest possible output of pig iron and steel from the available coke, current priority decisions tend more and more to throw smaller iron and steel plants into idleness, and the development of this policy is being watched closely throughout the industry.

No material or general readjustment of existing prices for rolled products is looked for, and the steel men contend that the uncertainties of the situation, which are already affecting demand, should be removed by making the new prices effective for at least six months.

Apart from the special plea of two large consuming interests for a reduction in Southern pig iron, because they located plants in the South to get the benefit of its low pig-iron costs, manufacturing buyers of iron and steel figure in no formal way in the present Washington conference.

Somewhat conflicting statements are made as to the extent to which Government and general business needs will take up steel-making capacity in the remainder of the year.—*Iron Age.*

—

No Present Change in Steel Prices

WASHINGTON, March 20—Existing prices for iron and steel are to be maintained for at least the next three months. This statement comes as a result of the conference between the War Trade Board and the representatives of the iron and steel industry which met in Washington yesterday.

—

$100 Increase on Columbia Cars

DETROIT, March 19—The Columbia Motors Co. has increased the prices of its models $100. They are:

Model	Old Price	New Price
5-Pass. touring	$1350	$1450
4-Pass. roadster	1495	1595
Sedan	2395	2495

The company will start the manufacture of trailers before the end of the month. The building formerly used as a storehouse will be turned into a trailer assembling shop.

—

Slight Advance in Oldsmobile Prices

LANSING, MICH., March 20—There has been a slight increase in the price of Oldsmobile models, as follows:

Model	Old Price	New Price
8-Cylinder touring	$1467	$1495
6-Cylinder roadster	1185	1195
6-Cylinder touring	1185	1195

—

Five Scientists to Test Garabed

WASHINGTON, March 20—Garabed T. K. Giragossian, the inventor of the new so-called virgin force which he calls Garabed, has submitted a list of nineteen scientists to Secretary of the Interior Franklin K. Lane. Secretary Lane has selected ten scientists from this list from which Giragossian will finally choose five to act as witnesses for the official test of the free energy generator. The names of the scientists together with all details of the tests are kept secret.

—

Detroit-Pittsburgh in 3 Days

DETROIT, March 18—A fleet of trucks were driven from the Standard Motor Truck factory to the Pittsburgh distributer, the Wilmer Sales Co., in 3 days' time.

A New Service

Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

Tone of Coal Market Generally Satisfactory

The tone of the coal trade is generally satisfactory. With the moderating weather, dealers are noticing a tendency toward an easier market. Domestic consumers are not so urgent regarding deliveries, though demand in all lines is still ahead of the supply.

In face of the repeated urgings of the Fuel Administration that householders stock their next winter's coal early, the demand from this class of buyers is disappointing. This may be attributed to the fact that the public generally seems to feel that the price of coal will come down on April 1 and, therefore, hesitates to place orders at the old figure. Also, dealers do not seem anxious to force sales until some sort of assurance is had that they will receive sufficient coal to take care of a strong early demand, as the quantity of coal now in storage is not great.

The improvement in rail movement during the last two weeks has failed to continue. The lines are again congested and there has been an appreciable falling off in the number of cars supplied to the mines. Few operators report more than a 50 per cent car supply, with the majority of shippers down to 25 per cent and lower. This means that the country will be faced with an even more serious fuel shortage next winter, unless the Government takes immediate preventive steps.

Consumers will likely have to pay more for their coal during the coming summer than they did the past winter, owing to the fact that the Interstate Commerce Commission has granted the railroads a freight rate increase of 15 per cent on bulk commodities, including coal. This increase, which will apply to all shipments east of the Mississippi River and north of the Ohio and Potomac Rivers, will mean an increase of from 18 to 30 cents a ton on the domestic sizes.—*Coal Age.*

—

G. M. Ratifies Stock Increase

NEW YORK, March 20—Stockholders of the General Motors Corp. have ratified the proposal to increase the capitalization of the company to $200,000,000; the action, suggested when the Chevrolet Motor Co. was made a division of the General Motors Corp., was taken at a special meeting to-day. The new issue will consist of $50,000,000 six per cent preferred and $150,000,000 common. The following directors were elected: P. D. du Pont, A. G. Bishop, W. P. Chrysler, R. H. Collins, W. L. Day, H. F. du Pont, Irene E. du Pont, W. C. Durant, J. A. Haskell, L. G. Kauffman, J. H. McClement, C. S. Mott, J. J. Raskob, F. W. Warner, and E. B. Linden.

Packard Truck Trains for Soldiers

DETROIT, March 16—Sixty Packard trucks are being driven from the Detroit factory daily, carrying two companies of soldiers. Six Dodge cars are also assigned to each company. The truck trains go via Toledo to the seaboard. Last week the total drive-aways from the Dodge Brothers factory alone amounted to more than 2400 cars.

—

Chevrolet Annual Meeting Postponed

NEW YORK, March 19—The annual meeting of stockholders of the Chevrolet Motor Co., which was to have taken place yesterday, has been deferred. It is understood that the postponement was necessitated by the recent decision to absorb the General Motors assets. The new date will be fixed shortly.

—

Reo Benefit Assn. Elects Officers

LANSING, March 19—The Reo Benefit Assn. has re-elected Jesse L. Stanley president. Clare Warner is vice-president; Don Gardner, secretary; Charles Coy, treasurer, and Fred Ackley and Herman Troy, trustees. The disbursements of the association for the year were $22,927.95, and the receipts of the benefit store were $55,261.30. The association assisted in many cases of sickness and injury to employees of the company.

Ohio Puts Aside $1,000,000 for Tractors

COLUMBUS, OHIO, March 19—State officials of Ohio are preparing a plan to purchase $1,000,000 worth of farm tractors and furnish them to farmers. The assistance of bankers and manufacturers has already been enlisted, and the state has set aside the money for the purchase. This will be loaned out to several country banks, which will finance farmers who require tractors.

An extensive plan for educating farmers in the use of tractors has also been worked out by the state. A school was opened on Feb. 11 on the state fair grounds here, and additional schools are being provided in several county seats.

Pennsylvania's Example of War Roads

(*Continued from page* 601)

The heavy war trucks which are coming over the road for that department are now being carried around this bad road on railroad flat cars. Such transportation is not available for privately owned trucks.

And yet this road was in fair condition a few weeks ago when it was frozen. It will be perfectly passable again as soon as the warmer weather has dried it out. When authentic information is received that this stretch of road has thoroughly dried out, no one need hesitate to drive over the road from the Great Lakes to New York by way of Pittsburgh and Philadelphia.

The State of Pennsylvania has done wonders in road-building during the last few years. The road from Philadelphia to Pittsburgh is practically a boulevard all the way, particularly the western portion, which has been completely rebuilt. The water-breaks on the mountain roads, once the terror of tourists, have all been eliminated, and the roads are drained by a modern system of culverts. There remain the usual bad spots on the outskirts of the towns, between the points where the State highway ends and the city pavement begins. Not only has the State of Pennsylvania constructed its main roads well, but it also maintains them in good order. The State owns a fleet of White dump trucks which constantly patrol the main roads. As soon as a hole is discovered, in goes a shovelful of gravel. As we had occasion to observe, the chauffeurs are expert axe-men as well, and when a tree is blown across the road it is quickly removed.

In New Jersey the roads of that State are not much to be proud of. There are stretches of fine roads, alternating with stretches of badly worn-out roads. The roads between Jersey City, across the Hudson from New York City, and Trenton are subjected to the wear of numerous heavy motor trucks in transit between New York and Philadelphia, but where the roads have been properly built, they show no signs of wear. The road leading into New Brunswick, built a number of years ago, is as good as it ever was, while the old water-bound macadam roads have gone to pieces.

Why is it that the State of Pennsylvania, which has done so much to build up its highway system and which has constructed a good road from Philadelphia across the State to Pittsburgh, and thence to Beaver Falls, should tolerate such road conditions as those existing beyond Beaver Falls?

Why is it that the counties of Ohio which have built so many miles of fine roads, including a good road from Cleveland to New Springfield, should neglect the few miles of road southeast of the latter town?

The answer is that each State has looked on its highway system as being purely a State problem. There is no town of any size in Pennsylvania northeast of Beaver Falls, so why build a road to a jumping-off place on the State line? Similarly, they reason in Ohio, "We will connect our own cities, but why spend money in improving a road to a little hamlet on our eastern boundary line?"

Fortunately, this condition of State insularity is disappearing. Pennsylvania has already declared its intention of improving its share of this stretch of road during the coming summer, and Ohio now sees the importance of taking care of its part of the road. In the meantime, now, while the frost is coming out of the ground, and next summer, when the road gangs get to work, the shortest and in every other respect the best highway for motor transportation between the Middle West and the Atlantic seaboard is practically blocked.

It is obvious that two points in our road-building and road-maintaining program must be emphasized as they never have been before.

First.—Each State must build and maintain its roads, not only from the State point of view, but also from a national point of view. It must examine into the question as to how its system of state highways fits into the general scheme of national arteries of transportation. If it has not linked up its State system of good roads with the system in each adjoining State, it must do so at once.

Second.—Each State must be made to see not only the necessity, but also the ultimate economy, of keeping snow off its roads in winter. If snow covers the roads during four or five months of the year, that means that every motor vehicle traveling over the roads during that period is using tire chains. It means further that every time there is a thaw, the water, instead of running off the road, is trapped by the snow and is held on the road to be subjected again and again to freezing and thawing with resulting disintegration of the road surface. If the snow is removed promptly from the road, tire chains are not necessary on the vehicles using the road, and the road is freed from the destructive action of recurrent thawing and freezing. The net result of keeping snow off the roads is a tremendous saving in road maintenance. This is not merely a theoretical consideration, but has been proved this year on the Philadelphia-Pittsburgh highway. This road, as already noted, has been kept free from snow, with the result that, despite the abnormally heavy traffic, the road is in need of fewer repairs this spring than in any previous year.

Any road was formerly considered a good road from the motoring point of view if it was maintained in satisfactory condition during the touring season—say from the middle of April to the first of December. It was taken as a matter of course that in the remaining four and one-half months of the year the winter snows and the spring thaws would render it more or less impassable. To-day, under war conditions, no community can boast of having good roads unless its roads are open for motor traffic twelve months in the year. If the highways are to supplement, as they must supplement, the railroads of the country in meeting the transportation needs of the times, the roads must be kept in condition all the year, just as are the railroads.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

United States Rubber Purchases Alco Plant

PROVIDENCE, R. I., March 18—The United States Rubber Co. has purchased the plant of the American Locomotive Co. here, which consists of about 10 acres of land with extensive buildings, and adjoins the Revere plant of the United States Rubber Co. It is understood that the purchase price was about $500,000.

According to President Colt, the company will immediately equip part of the plant for the manufacture of truck tires. Another part will probably be used for making balloons for the United States Government.

The plant was originally built by the American Locomotive Co. for the manufacture of Alco cars, which enterprise was abandoned in 1912. Lately it has been used for munitions work.

—

International Motor to Build Annex

PLAINFIELD, N. J., March 9—The International Motor Co. has prepared plans for the erection of a 4-story building adjoining its plant on West Front Street. There will be 85,000 sq. ft. of floor space in the annex, most of which will be used as a factory and the remainder as a stock room.

—

New Winther Model Completed

KENOSHA, WIS., March 18—The Winther Motor Truck Co. has completed the first model of a new type of quadruple drive motor truck designed especially for army service, and the car is now in the hands of Government engineers for exhaustive tests.

—

35 Per Cent Gain in Goodyear Sales

AKRON, OHIO, March 18—Sales of the Goodyear Tire & Rubber Co., according to estimates, will aggregate $150,000,000 for the 10 months ending Oct. 31, 1918, a gain of 35 per cent over 1917. Gross business is about 40 per cent heavier than a year ago, and three-quarters of this is represented by tire sales. Non-tire products turned out by the company last year amounted to $25,000,000, and this year will probably reach $35,000,000, or approximately 16 per cent.

—

Canadian Branch for Monarch Tractor

WATERTOWN, WIS., March 18—The Monarch Tractor Co., Chicago, Ill., with main works here, has organized the Monarch Tractor Co., Ltd., of Canada, to handle its business in the Dominion and to own and control a branch plant to be erected there at once. The Watertown works also will be enlarged to better enable the company to meet the demand for tractors.

—

Commerce Gets $2,000,000 Contract

DETROIT, March 16—The Commerce Motor Car Co. has received a government contract for more than $2,000,000 worth of Commerce trucks. To carry the heavy inventory the company has authorized the sale at par of $100,000 of treasury stock. This will be offered to stockholders in the ratio of one for every three shares held.

—

Detroit Pressed Steel Has Signal Corps Order

DETROIT, March 18—The Detroit Pressed Steel Co. has received an order from the Government for 19,000 steel wheels for the Signal Corps. Production on this order started 30 days ago, and the first delivery will be made this month. It is expected the order will be completed by the end of May.

—

30 Duplex Trucks a Month

LANSING, MICH., March 18—The Duplex Truck Co. will increase its production to 300 trucks a month for the remainder of the year.

—

Addition for Ladish Drop Forge

CUDAHY, WIS., March 18—The Ladish Drop Forge Co. will erect a new drop forge shop. This will be ready June 1.

—

Dividends Declared

The Edmund & Jones Corp. has declared the regular quarterly dividend of 1¾ per cent on preferred stock, and 25 cents a share on the common stock, payable April 1 to stock of record March 20.

—

The Keystone Tire & Rubber Co. has declared the regular quarterly dividend of 2 per cent and an extra dividend of one-third of 1 per cent on preferred stock, and a regular quarterly dividend of 3 per cent on the common stock, payable April 1 to stock of record March 22.

—

The Air Reduction Co. has declared regular quarterly dividends of $1 on the common stock and 1¾ per cent on the preferred stocks, payable April 15 to stock of record March 30.

—

The Reo Motor Car Co. has declared the regular quarterly dividend of 2½ per cent on common stock, payable April 1 to stock of record March 15.

—

The Pennsylvania Rubber Co. has declared a regular quarterly dividend of 1½ per cent on common stock, and 1¾ per cent on preferred stock, payable March 30 to stock of record March 15.

—

Capital Increase

GREENVILLE, MICH., March 18—The Tower Motor Truck Co. has increased its capital stock from $100,000 to $200,000.

Plans Already Completed for Ford's Tractor Plant

DETROIT, March 18—The permanent tractor plant of Henry Ford & Son will be located on the Ford property directly opposite the blast furnaces. It will employ approximately 25,000 men. The Dearborn plant was used as an experiment station and 50 different models were built before the present perfected tractor was decided upon.

The permanent plant will include a foundry, 120 x 225; stock room, 30 x 100; heat treating room, 40 x 145; assembly shop, 44 x 165; assembly shop, 44 x 105; pattern shop, 50 x 105; gas producer plant, 70 x 45; machine shop, 285 x 75; another machine shop, 225 x 90.

—

To Make Manning Carbureters

JANESVILLE, WIS., March 18—The Manning Carburetor Co., organized some time ago at Janesville, Wis., by Elmer J. Manning, Ft. Atkinson, Wis., and H. B. Warne, Janesville, has completed experimental work on a carbureting device designed and patented by Manning. The company is ready to engage in regular production. The carburetor will be marketed under the style Manning.

—

Government Gets 1500 More Packards

DETROIT, March 16—The Packard Motor Car Co. has just delivered 1500 more trucks to the United States Government, making a total of 3500. The remainder will be delivered as fast as they can be produced.

—

Electric Plant for Topp-Stewart

CLINTONVILLE, WIS., March 16—The Topp-Stewart Tractor Co., which recently completed and placed in operation its new tractor plant in Clintonville, Wis., is constructing a large hydro-electric power plant on the Embarrass River, about twelve miles north of the city. It will furnish current for the operation of this and other Clintonville industries. The investment will be about $100,000.

—

Curtiss to Redeem 6 Per Cent Notes

BUFFALO, March 16—The Curtiss Aeroplane & Motor Corp. will redeem on March 29 all of its 6 per cent serial gold notes dated Jan. 1, 1917, at the price of 102½ per cent of the principal amount and accrued interest. Redemption will be made at the office of the Central Trust Co., 54 Wall Street, New York.

—

J. H. Faw Moves

NEW YORK, March 16—J. H. Faw, Inc., accessory manufacturer, is moving from 41 Warren Street to larger quarters at 37 Warren Street.

—

Addition for Buda Co.

HARVEY, ILL., March 19—The Buda Co. is erecting a 4-story addition for assembling and testing truck and tractor engines.

Digitized by Google

Signal Corps Needs Many Electrical Men

WASHINGTON, D. C., March 18—The Signal Corps, United States Army, has announced that it can use the services of a large number of men having electrical training. They are needed especially in connection with the radio communication systems in use in the military service.

All classes of electrical men—wiremen, expert electricians, storage battery men, telegraph and wireless operators, and men with electrical engineering training and experience are wanted. The opportunity offered is exceptional because of the great interest and importance of this branch of the service, which has been most aptly characterized as the nerve system of the army.

Application blanks for service in the radio work of the Signal Corps may be secured by addressing the Office of the Chief Signal Officer, Land Division, Training Section, Washington, D. C. Men of draft age may make application and if qualified will be inducted into the army, at their request, for service in this branch of the Signal Corps. After enlistment or induction, all personnel will be sent to one of several radio schools for six weeks to three months of intensive training in one of the three general branches of the radio work for which their previous experience qualifies them. Some of the personnel completing these courses will be commissioned, and the opportunity for advancement for all graduates will be dependent on the individual ability.

—

Brookings Heads Price-Fixing Committee

WASHINGTON, March 16—Robert S. Brookings, commissioner of finished products of the Council of National Defense, has been appointed chairman of the price-fixing committee of the council. He retains his position as commissioner of finished products, but this department will be operated temporarily by Charles M. Peak, appointed vice-commissioner, and who also has charge of the conversion of non-war industries.

—

Opposed to Smaller Salary for Aviators

WASHINGTON, March 18—The Senate Military Committee unanimously disapproved of the repeal of laws providing for extra allowances to aviators. The reduction was recommended by General Pershing and Secretary Baker. It was shown that reliable army hazards statistics were not available and British and French aviators told the committee of the conditions and danger of their work.

—

Restrict Bonus Law for Aviators

WASHINGTON, March 18—Secretary Daniels has announced that in the future Navy aviators will be required to make a certain number of actual flights before being entitled to the usual 50 per cent bonus.

—

$75,000 Appropriated for Standardization

WASHINGTON, March 16—The urgent deficiency appropriation bill, totaling over a billion dollars, passed by the Senate yesterday, contains, among others, the following appropriations:

For engineer department operation in the field, including purchase of material, construction of storehouses, purchase operation, maintenance and repair of horse-drawn and motor-propelled, passenger-carrying vehicles and for ordinary engineer depot expenses; $17,000,000.

To enable the Bureau of Standards to provide scientific assistance necessary in the development of instruments, devices, materials and standardization and testing of supplies for the War and Navy departments; $250,000.

To enable the Bureau of Standards to cooperate with the War and Navy departments and the Council of National Defense for the standardization and testing of standard gages, screw threads and standards required in manufacturing in U. S. and to calibrate and test these; $75,000.

Licenses Now Required for All Enemy Trading

WASHINGTON, March 16—The War Trade Board has determined that branches of corporations and other American concerns established in neutral territory or in territorial countries associated with the United States in the war shall obtain an enemy trade license from the War Trade Board before performing contracts which involve trading with an enemy or ally of enemy. As announced in January the War Trade Board has authorized such American concerns in foreign countries to perform all legal obligations enforcible in the courts of the country where such branches are established, notwithstanding that such performance should involve trading with an enemy or ally of enemies. This authorization, however, has been rescinded and all such branches must hereafter obtain a special enemy trade license as outlined above. Two exceptions to this are (1) that foreign branches of American houses are licensed to deal in enemy commercial paper when refusal may result in failure to collect a debt or may be a violation of local law, and (2) that branches of American banks are authorized to receive enemy paper for collection under such circumstances.

—

300 Per Cent Increase in Oil Price

WASHINGTON, March 18—Statistics of the oil industry gathered here show sharp advances in the price of crude oil in the last 3 years. Since 1915 the price of Pennsylvania grade oil, which is typical, has increased from $1.35 to $4, a gain of 300 per cent. In 1915 United States crude oil production was 11,000,000,000 gallons, and in 1917 13,250,000,000. Most of this increase was used for domestic purposes, the amount exported being almost stationary for the last 3 years. Practically all of the gasoline exported is for the war needs of the allied nations.

Bigger Balls—and more of them—give Gurney Bearings greater capacity

A number of years ago a German Professor named Stribeck published the formula which is commonly used for figuring the permissible loads on a ball bearing.

Stribeck's formula shows that the capacity varies directly as the number of balls used and as the square of the ball diameter, but it remained for a Yankee—F. W. Gurney—to invent a method of assembling bearings that would take full advantage of the laws stated by Stribeck and give the world a bearing of the greatest capacity in the smallest size.

The Gurney Bearing has more balls or larger balls, or both, than other annular bearings. When compared with other annular bearings it is found that the load capacity for the Gurney bearings figures out from 44% to 75% greater than other bearings of the same size.

Comparative tests of different types of bearings made by distinterested parties have proved that these theoretical figures are supported by the actual performance of the bearings under load. In many cases this additional load capacity permits savings in a machine design that are worth more than the total cost of the bearing.

Our Engineers will be glad to cooperate with your designers in making such savings on your product.

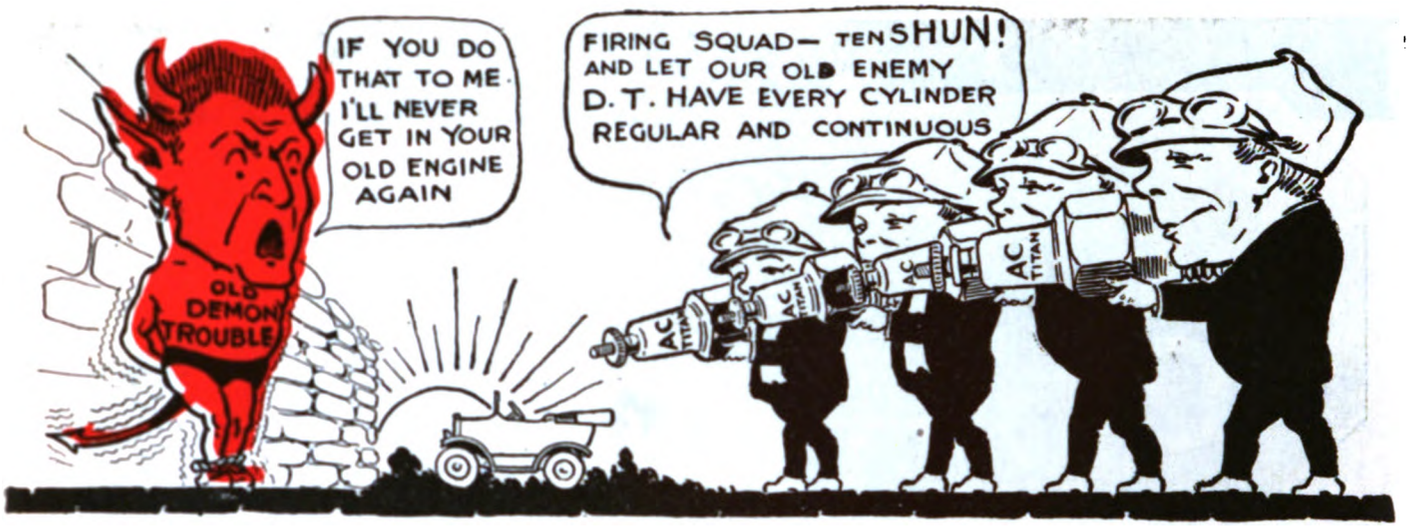
The Control of Quality
Point No. 12

Magnetic chuck in use in the Timken Grinding Room.

In the Grip of Jove

Face down upon the magnetic chuck, the Timken grinder lays the hardened cup. With a turn of the switch he closes the electric grip which holds the steel firmly in place. A few touches of this alundum wheel, and the back face of the cup is a true plane surface.

On this newly trued surface another chuck grips the work—lightly this time for the piece must be perfectly centered. At almost the first touch of the grinding wheel on the tapered surface the true center is found. Instantly the grinder switches on the heavier current that tightly fixes the work in place.



With the electric chuck every atom of the steel is held uniformly so that even the slightest distortion is avoided. Thus absolutely parallel plane surfaces, perfect concentricity, and true tapers are secured.

Just a small point, but necessary to preserve the extreme accuracy so essential to the control of Timken Quality.

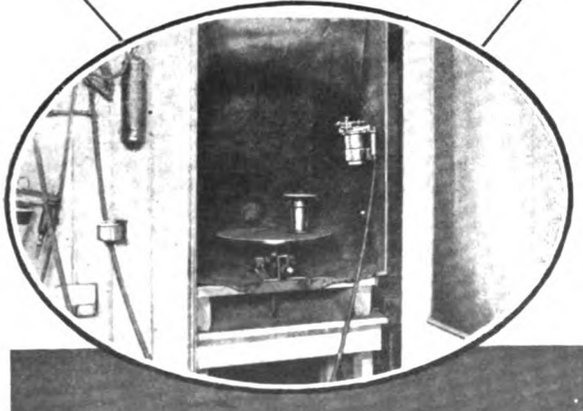
"After months of dust—

—and rain."

Bring This Experience To Your Problems.

What we call a "Better-the-Finish" Laboratory is maintained by us for the special benefit of our customers.



Here your individual problem will be studied from every possible angle. Tests will be made under methods similar to your working conditions. When a solution is arrived at, the particular finish produced will meet your needs exactly, and any suggested change in method will be improvement or economy.

Manufacturers who have used this service have saved money as well as improved their products.

Let us see if we cannot improve your finishing methods—at no cost to you.

Manufacturers handling government work should bear in mind that our experience in co-operating with firms handling similar work is at their disposal.

Corner of B.T.F. Laboratory Showing Spray Brushes and Hood, with Outlet for Sucking Away Fumes.

What of the Finish on Your Cars After Six Months on the Road?

Will it look well—does it stand up, after months of dust, and rain, and road oil?

Appearance sells the car when new. Will its appearance after months on the road sell another?

This is not necessarily a matter of the number of "coats" applied, added expense to the manufacturer, etc. It is a matter of materials and methods.

HILO

Enamels—Japans—Varnishes

A proper selection of materials, a correct plan of applying them, frequently means a saving—certainly of time and labor, sometimes of money as well.

But it means a great deal more than that—it means a finish that can be depended upon, a protective finish that will firmly adhere to the metal, that will be unaffected by dust, rain or oil, as well as retain the smooth, attractive appearance that gives the car a reputation for lasting excellence.

Write for our Bulletin No. 1, on Black Enamels and Japans. It contains information that will help you, whether you buy from us or not.

LUBRICATION

In a Truck Axle, Nothing is More Important Than Lubrication

ONE of the Big Advantages of the Sheldon Worm Drive is the perfect mechanical enclosure of the mechanism running in a bath of oil.

Even the wheel bearings enjoy this plenitude of lubricant; for it is automatically conveyed to the central housing, and, since proper closures are provided, there is absolutely no danger of lubricant saturating the brakes.

In speaking of the very thorough manner in which the lubricant is distributed on the SHELDON axles, attention may also be called to the efficient protection afforded the mechanism against the entrance of dirt, water, grit, etc.

Provision is made for lubrication through a big filler cap, which is so easy of access that there is small likelihood of its being neglected, or overlooked, by the driver.

It Used to Take All of These

Night and day, seven days a week, the machinery of a big middle-west plant* struggled against the overwhelming demands upon its capacity.

Production—more production—still more production—that was the only way out.

In such a situation, equipment which in normal times appears good enough is likely to show up in its real weakness, unable to stand extraordinary strain.

In this case it was the bronze gears on drill presses being used for heavy work. To the men in charge of these presses, it seemed as if the gears required constant changing. Sometimes they lasted but three days, sometimes four, seldom more than five.

And, of course, every gear change cost the time of man and machine, which meant both decreased output and increased costs.

Then a *Lynux* representative suggested that they give *Lynux* 91 Gear Bronze a trial at this difficult job.

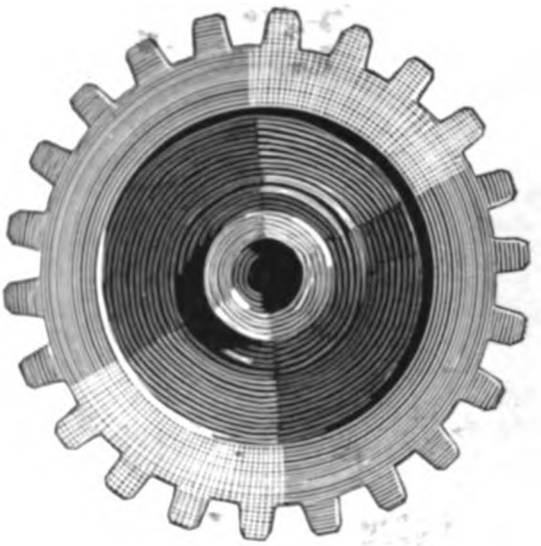
Today instead of changing gears every four or five days, they change them only once in three months or more.

One gear is doing the work that twenty-five used to do.

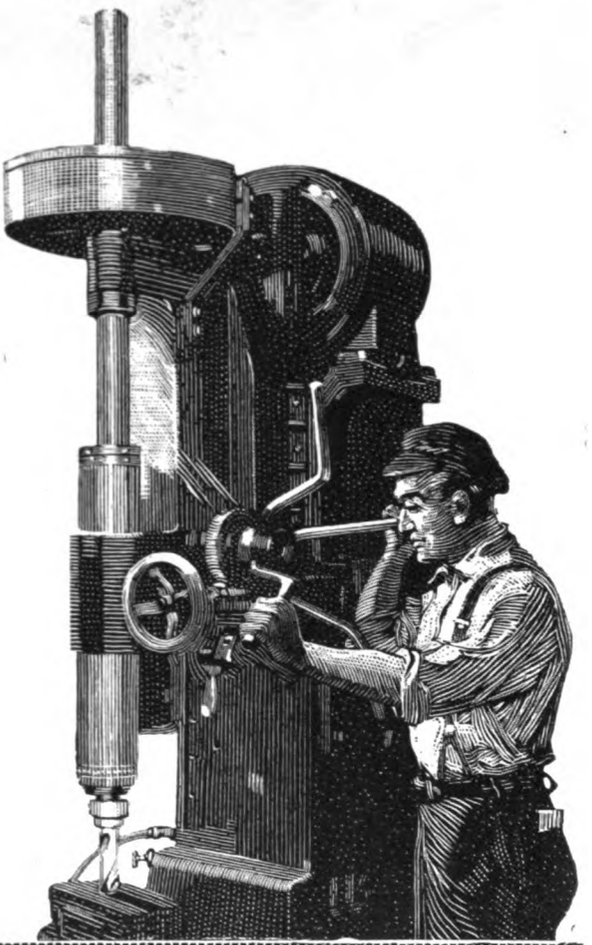
There's one stop now where there used to be twenty-five.

There's one minute lost where there used to be twenty-five.

There's one gear to pay for where there used to be twenty-five.



What *Lynux* 91 Gear Bronze may add to the life of *your* gears depends upon your own conditions. But this you can be sure of—that with a tensile strength of 75,000 to 100,000 pounds to the square inch, *Lynux* 91 is a superior bronze for heavy-duty.



*Name on request.

LYNUX
BRONZES

to Do What this One Now Does

Lynux 91 Gears Cost *Less*

Lynux 91 gears cost less because they can be made with cast-teeth, which saves milling cost. They are lighter than ordinary bronze gears because the metal itself weighs fully 12 per cent less and an additional weight reduction is effected by coring the teeth.

The exceptional quality of *Lynux* 91 is largely due to the highly scientific methods employed in *Lynux* foundries, which have put brass and bronze casting in this country on a new plane.

Lynux foundries are equipped to turn out practically every kind of brass and bronze casting, from an ounce to a ton.

Lynux Bushings and Bearings are widely known for their excellence.

Let us send you our monthly mailings on subjects that interest the buyer of brass and bronze. Address Dept.47, Cleveland, Ohio.

Are you familiar with LYNITE, that remarkable group of aluminum alloys? If not, ask us about it. LYNITE is the ideal metal to use where lightness is required.

Why efficiency experts like it—because it represents the acme of efficiency for its purpose.

Auto-Lite

Starting, Lighting & Ignition

The One Thing All Can Agree Upon

You may prefer a different body style, a different number of cylinders or a different priced car than your neighbor owns.

But there is one fundamental necessity for all cars the vast majority agree upon.

They want the electric Auto-Lite System.

They want it because they trust the judgment of engineers who equip their high-priced cars with Auto-Lite.

And because the world's largest car builders use Auto-Lite.

And because its work is so important that builders of lower-priced cars are willing to pay more for the better service Auto-Lite gives rather than risk inferiority.

And because they know it must be superior, otherwise Auto-Lite would not be the largest in the world with a daily output of 1800 systems.

Be sure the next car you buy has Auto-Lite equipment.

"—and 360 of these little tots, their souls wrung with the torture of denial, turned away—*to die.*"

There they were, in front of our Relief Station, some sitting, some leaning against the wall—for they were weak, these tiny sufferers. Of our scant supply of food there remained but enough for 70, with 430 yearning, craving stomachs waiting in hopeful anticipation. And, oh God, the look of agony that went up from those 360 who were turned away unfed! They trudged off, so wearily, so painfully, so hopelessly—where?—***wherever there was a place to lie down and die.***

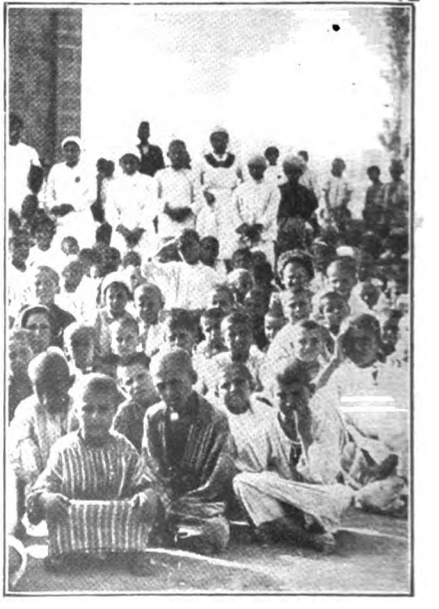
And that night a government cart rolled down the streets on a gruesome errand. * * *

Yes, this is true, and typical of the plight of 400,000 other little mites in Armenia and Syria, victims of the religious fanaticism of their Moslem masters. Torn from their homes (and such happy homes they were!) with relentless brutality during the recent campaign of murder and pillage conducted by the Turks, they were forced by these German-led troops to flee across the desert, while fathers and older brothers were butchered, mothers and sisters outraged.

This is Armenia, this is Syria, once the fair home of a cultured and prosperous people, now a symbol of Turkish ruthlessness—a shambles. To this not even the tragedy of Belgium is comparable. And all that is left to the two million and a half survivors is starvation, unless—and this part is ***wholly up to you***—unless the work of relief, so ably started, is given sufficient financial support to continue. However little you have, of that little you can spare ***something*** to help lift the cloud of desolation that hangs so heavily over this hapless land.

The Price of One Cigar a Day Will Save One Life

Seventeen cents a day ($5 a month) will keep one child properly nourished. No American business man can refuse so slight a sacrifice in so noble a cause —and it's America ***alone*** that can help. Give what you are able to: all you can—but give this little ***at least.*** Pledge yourself to the maintenance of one child—more if you can. Remember, there is a little life ***dependent on you!*** Whether you send $1, $5 or $100, every penny you donate will go for relief, as all campaign expenses are met privately.



Send all money and make checks payable to

When Mr. Schwab Discusses Steel—

he is sure of an interested audience.

When Mr. Edison discusses electrical innovations, we listen to him with respect.

When Signor Marconi speaks of wireless, every word has weight.

Whenever recognized authority expresses itself, we can rely upon its opinions and judgment.

So, when the motor manufacturers who are known to maintain the highest structural standards adopt Eisemann Magnetos as standard equipment, isn't it conclusive evidence of superiority?

In the truck field, where the hardest tests come, 81 manufacturers have done so. Most of the recognized leaders are included in that number.

SUNDERMAN
Vacuum Carburetor

Model F

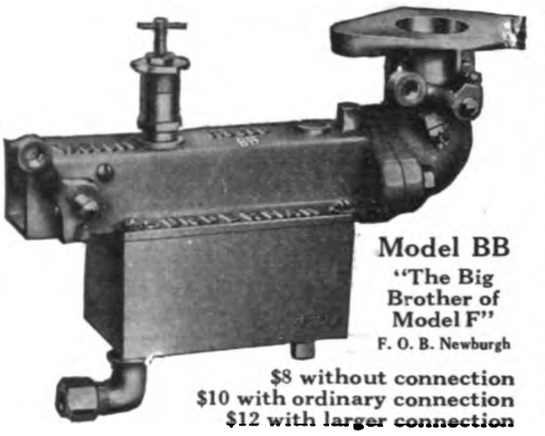
PRICE

$6 F. O. B. Newburgh

For Ford, Metz and Saxon Four

TWO million cars now running in this country need this model F Sunderman Carburetor.

It contributes—**actually** contributes—many times its cost every year to the owner who installs it on his car in the saving on gasoline.



It saves from 30% to 50% on **any** car, and on the Ford, Metz and Saxon Four the average is nearly 50% always, with a saving beyond that point frequently reported.

It gives more power to all cars—and to **these** cars a power their designers never even hoped for. It gives them a flexibility that is a joy to the driver of eights and twelves, but which the driver of a small car never before experienced.

It gives them a **getaway**—a pick-up, a rugged hill-climbing ability—that were never bought with the car.

Now is the time to buy this carburetor—you should put it on your car this month and let it begin to make good for you right away.

SEE YOUR DEALER NOW—OR WRITE US DIRECT TODAY

Model BB

"The Big Brother of Model F"

F. O. B. Newburgh

$8 without connection
$10 with ordinary connection
$12 with larger connection

THE development of Model BB Sunderman Carburetor is the simple, logical outcome of the tremendous demand that has been created by satisfied users of our Model F. The latter has scored a success so great that its utility as a universal carburetor cannot be challenged.

For Larger Cars

Model BB embodies every feature of Model F, but the float has been redesigned, enlarged, and its position changed to make its installation easier on the great variety of large cars. The jets are encased in a mesh screen (patent applied for) which serves to strain the gasoline at the intake.

This model also serves still further to gasify the charge because of the higher lift due to the change in position of the float chamber, and the result is a mixture so easily explosible as to make starting easier than ever.

This carburetor—Model BB—will make that used car you're going to buy step out like a 1918 winner.

Steel for Service

Increased Production Schedules

mean an increased strain upon every machine. If each machine is not well designed, or if any part is not made of the best materials obtainable, serious trouble will develop sooner or later.

Gears are an important part of each machine. If they fail the machine is idle until a like gear can be obtained from the storeroom or from its manufacturer and put in place in the machine. Meanwhile your production schedule is tied up.

Many manufacturers are using gears made from

Carnegie Rolled Steel Blanks

in order to protect their increased production schedules against delays due to breakdowns or too frequent renewal of gears.

Severe industrial use has proven that gears made from Carnegie Rolled Steel Blanks wear three to seven times as long as cast steel gears. Such gears cost slightly more but their long life and protection against breakdowns make for real economy in the long run.

Safeguard your increased production schedule by using gears made from Carnegie Rolled Steel Blanks.

"carwen-balanced"- what it might mean

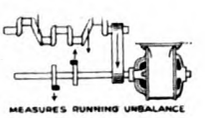
Try to measure in fighting terms the value of completely eliminating crankshaft vibration from all our airplanes at the front. It would mean—

Less fatigue for the pilots;

Less distraction for the observers;

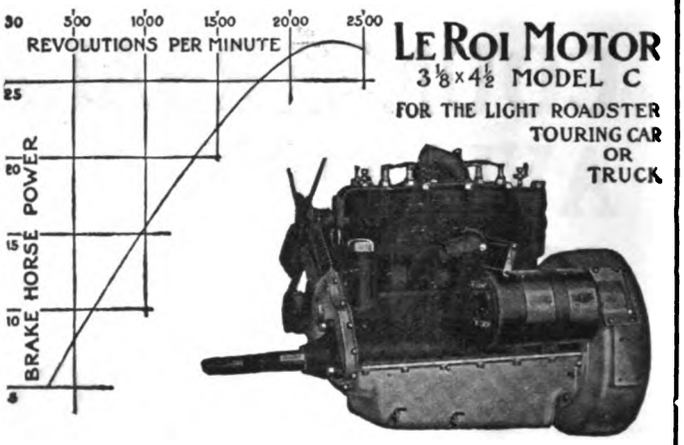
A better chance to sight both guns and bomb-dropping devices;

Less racking for 'planes and motors, and fewer mechanics to keep them going.



In effect, a substantial increase in our air force, through the heightened efficiency of each unit.

And it would cost less money, less skilled labor, less priceless time, than the cut-and-try methods once necessary.



The entire process of balancing a motor crankshaft by the Carwen method takes approximately twenty minutes. The result is mathematically precise.

HOOVER STEEL BALLS

THE WORLD'S STANDARD

4,500,000 Motor Cars and Motor Trucks Carry Them

This number of passenger and commercial cars represents 95 per cent of the total in North America.

The Hoover Steel Ball has, through force of merit, supplanted the high grade steel balls formerly supplied to the world only by Germany, and has brought supremacy in this industry back to the United States, where it originated.

The romance of the steel ball industry makes a deeply interesting tale of the triumph of American financial, industrial and scientific preparedness and progressiveness. This story, told in a book, "The Evolution of the Steel Ball Industry," will be sent on request.

HOOVER STEEL BALL COMPANY, Ann Arbor, Mich., U.S.A.

Crank shaft Machining

The Indispensable Requisite

There is as little place for guesswork or indifferent methods in crankshaft machining as in navigating the ocean. They don't **belong.** Accuracy can't be guessed at—alignment and balance cannot be "approximated"—they must be a **mathematical certainty.**

MOLTRUP

Machining methods have been brought to their highest state of perfection in the MOLTRUP plant. Big, roomy, spacious, with the latest equipment, the most skilled mechanics, the most careful supervision, the home of MOLTRUP stands as a symbol of efficiency in its chosen field. It has stood so for twenty years, growing in size and ability as the demands of the automotive industry increased.

If having it done **right** and getting it **on time** are the real essentials in **your** specifications send us your blueprints for estimates.

We also manufacture Cold Drawn Screw Steel and Shafting, Flats, Squares, Hexagons and Special Shapes, Finished Machine Keys, Flattened Steel Foundry Pattern Plates. Write for quotations.

Getting all he pays for

When a man buys your truck he buys a definite carrying capacity over a certain distance at a reasonable operating cost.

Give him the means to check that up. Show him that your truck *does* deliver that mileage under load and at reasonable expense.

Progressive truck makers who have installed the Dreadnaught Hub Odometer as regular equipment find that it makes trucks more salable.

The biggest truck users in America use the Dreadnaught extensively.

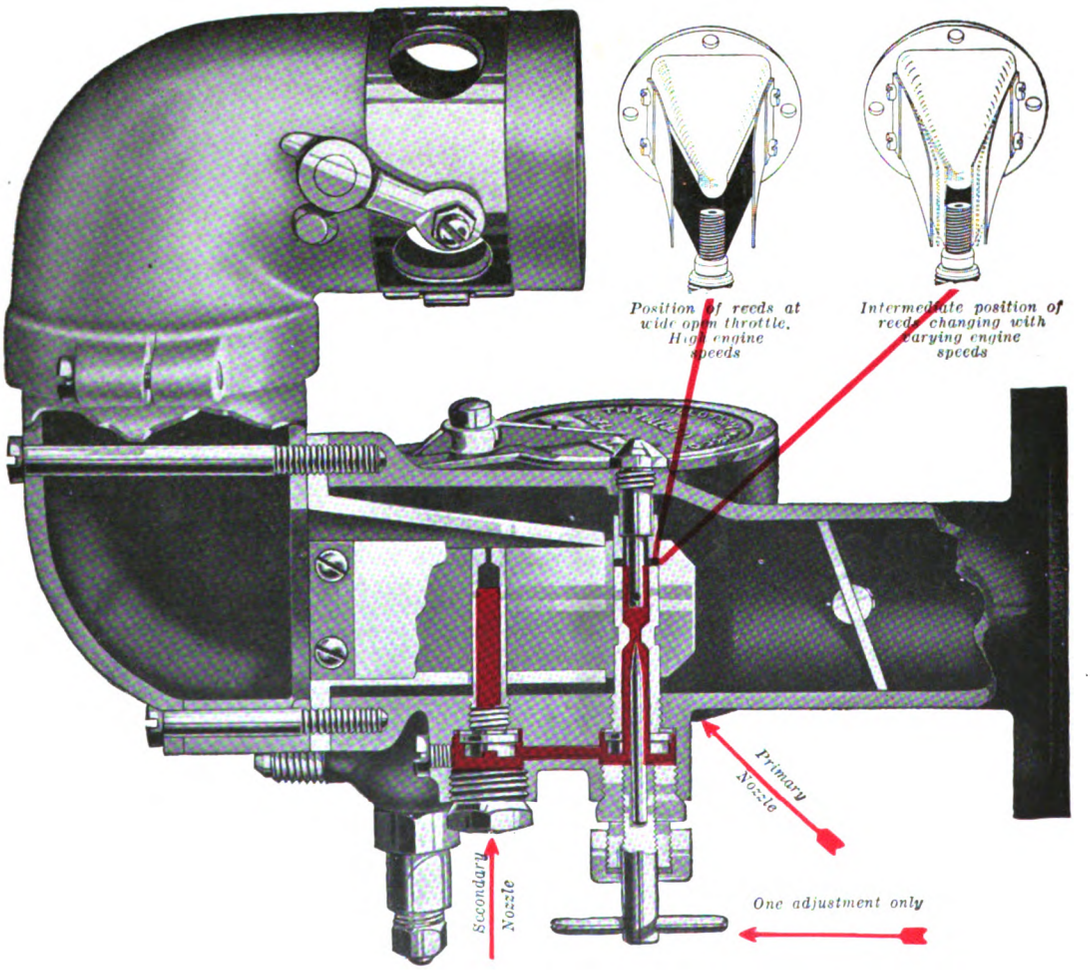
Tillotson
CARBURETOR

IN THE illustrations below we have endeavored to bring out the chief points of advantage in the Tillotson design.



The smaller views of our automatic air valve feature show how the two flexible steel reeds expand and contract so as to maintain at *all* engine speeds the *highest possible vacuum* and *greatest air velocity* at the point where the fuel nozzle is located.

The Primary Nozzle furnishes fuel at *all* speeds, but at the slower engine speeds is the only one called upon. The only adjustment necessary on *any* Tillotson model is the one that regulates the flow of gasoline.

The Secondary Nozzle automatically begins to furnish fuel at the higher engine speeds. It is the reserve supply—always ready but never used except when higher speeds demand it.

We believe we can prove to your absolute satisfaction the superiority of the Tillotson design. Ask for the proof.

JOHNSON'S RADIATOR CEMENT

Repairs Leaky Radiators Instantly

Stop Those Leaks

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks in just a few minutes without laying up the car. No mechanical experience is required—all you have to do is to remove the cap and pour the cement into the radiator.

JOHNSON'S RADIATOR CEMENT

Johnson's Radiator Cement blends perfectly with the water until it reaches the leaks—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.

Quick—Efficient—Harmless

Johnson's Radiator Cement contains nothing which can clog or coat the cooling system. It will ordinarily seal leaks in from two to ten minutes. It requires no experience to use Johnson's Radiator Cement.—All you have to do is to remove the radiator cap and pour it in.

Quarts, $1.75 Pints, $1.00 Half-pints, $ .65

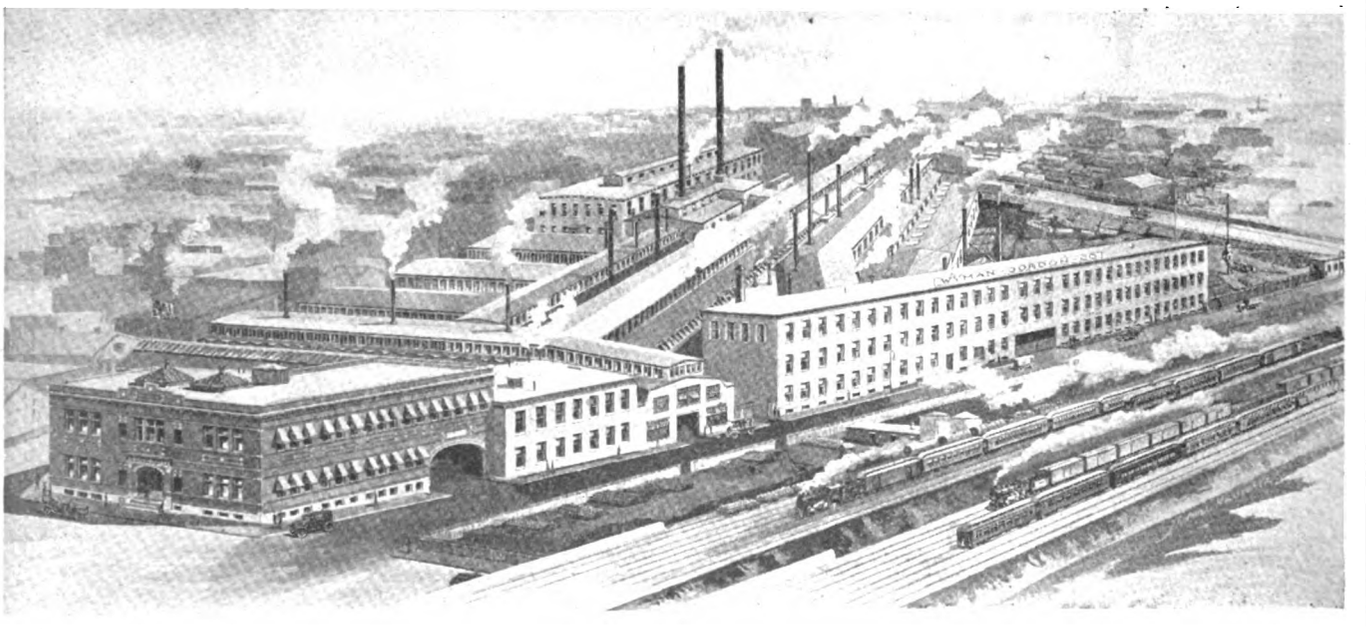
GUARANTEED FORGINGS

The WYMAN-GORDON *GUARANTEE*



THE WYMAN-GORDON GUARANTEE is the simplest and strongest method we can adopt to let our customers know that every precaution has been taken, that every procedure recommended by modern engineering practice has been adopted, to assure the delivery of a satisfactory product.

FROM THE THOROUGH TESTING of every billet of steel, through the delicate heat-treating processes and other details of manufacturing technique, down to the careful scientific marking of each forging to indicate proper machining, every step of the process is checked and rechecked to preclude, as nearly as human ingenuity may, the possibility of error.

We specialize in the solution of difficult and unusual forging problems.

"NORMA"
BALL BEARINGS
(Patented)

The ultimate measure of a car or truck is in the strength of its weakest, not its strongest, feature. Appearance may deceive, but performance will surely reveal the integrity—or otherwise—of the design, construction and equipment. Let your scrutiny of service qualities extend to every detail of every accessory.

There is a distinguishing mark by which magnetos and lighting generators which deserve your unqualified confidence may be identified. That is the presence of "NORMA" Ball Bearings—the standard bearings adopted by accessory builders to maintain the high quality of their own product.

Be *Sure*—See That Your Electrical Accessories Are "NORMA" Equipped

Conservation

Save engine from road racking and impaired efficiency.

Save tires from road "wallops" and wear and tear.

Save car from the ravaging effects of vibration.

Save passengers from jolts, jars and riding discomforts.

Give last year's car a new lease on life

Prolong the efficiency of this year's purchase

Promote economical maintenance

If your car is old, you can restore, in a measure, its original efficiency; improve its riding qualities; prolong its usefulness.

If your car is new, you can safeguard it against road racking, adding years to its life; broaden its range of travel; cut the cost of its maintenance.

The

★Hartford
SWIVEL TYPE
SHOCK ABSORBER

—Kills off road shocks, the great deteriorating factor in automobile operation and upkeep;
—Stops tire bouncing, so wearing and tearing to rubber and fabric;
—Offsets the ravages of that subtle evil—vibration—which racks car, engine and parts, sapping their vitality and shortening their usefulness;
—Saves fuel by conserving power, because it protects an engine from road jolts, which impair its efficiency.

Economy prompts the use of this pioneer shock absorber. So does Comfort.

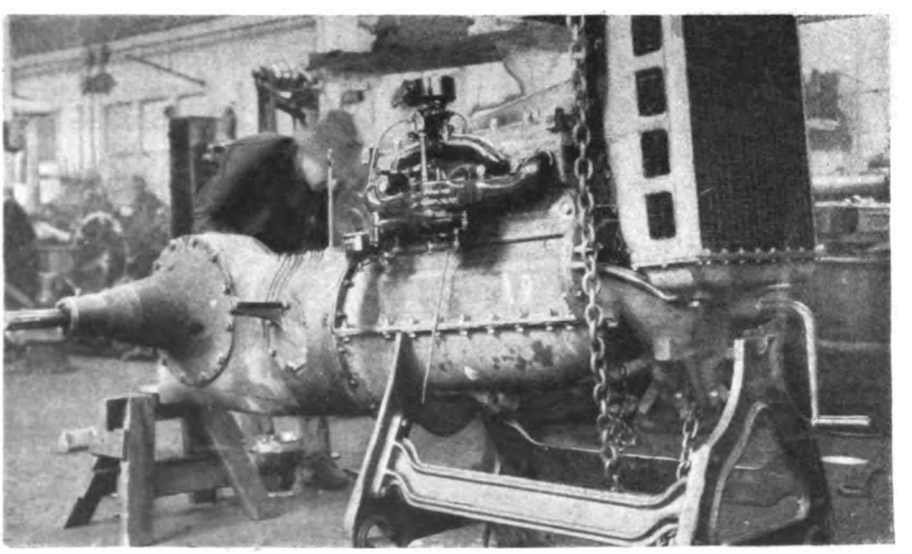
VOL. XXXVIII NEW YORK—THURSDAY, MARCH 28, 1918—CHICAGO No. 13

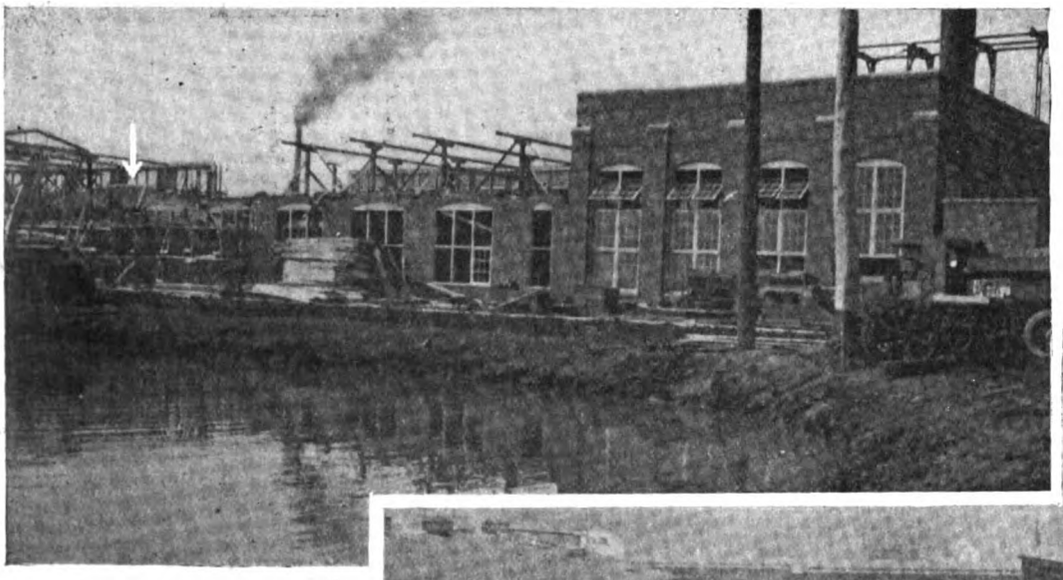
Ford Tractor Production Plan Unchanged in Growth



Output to Increase From Eighty-Five Per Day To Two Hundred Per Day in Three Months —Progressive Manufacture and Assembly Maintained in Spite of Rapid Growth

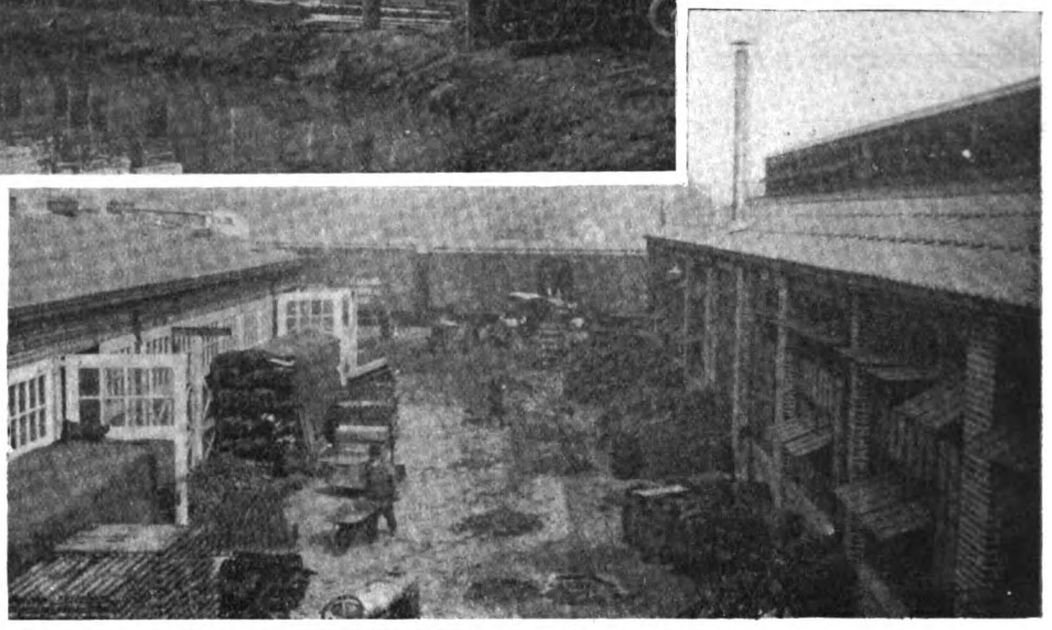
By J. Edward Schipper

FORD tractor production at the present time is eighty per day. It is being stepped up rapidly each week, the planned schedule being eighty-five tractors daily by the end of March, 125 daily by the end of April, 150 daily by the end of May, 200 a day in June, and 300 a day by next December. This clearly represents a growing plant, and a plant which is in full production at the same time it is growing.



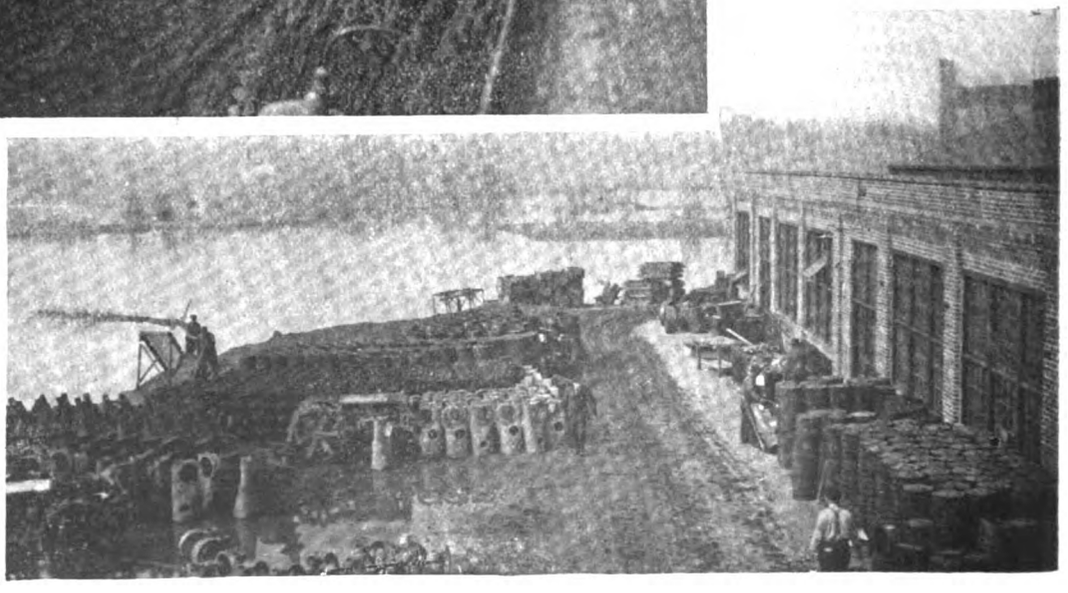
A story of the layout of the plant is necessarily a snapshot of a moving object. The plant does not look the same one week as it did the week before. Departments now found in one building, three weeks from now may be in a building which does not exist at the present time. Nevertheless, there is a fundamental scheme which has not been departed from with all the changing about necessary in a plant producing and growing at the same time.

Just at present a big office building, which will house all the executives, is growing up at the front end of the large, oblong plant occupied by Henry Ford & Son at Dearborn. It is growing up around the small brick building which houses the present inadequate offices. It completely surrounds this little building, but even while the structural work is going on the interior of this little building is not disturbed. Its walls remain standing and form part of the walls of the new building which is going up; that is, the little building ceases to be a building and becomes a room, and when



Final assembly of the tractor. This one is just about ready to receive its wheels

Digitized by Google

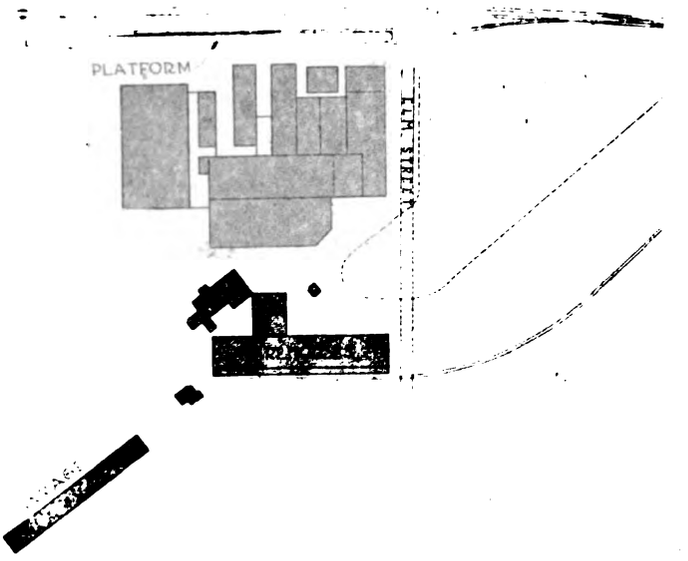


The new office and administrative building which is going up around the little building which formerly filled this purpose. The roof of the little building is indicated by the arrow, and when the new building is complete the roof will be lifted, leaving the interior undisturbed as a room

Bay between two of the buildings now occupied by production stock, but which will soon be roofed over to form a heat treating plant

Some of the stock necessary to maintain a steady production of eighty-five tractors per day. In 10 days an immense warehouse for storing this stock will cover this ground. The lumber for the warehouse is seen in the back ground

Old core sand from the foundry is being used to reclaim more land for the factory building. Some production stock and a few finished tractors which help in working around the plant are shown here on the reclaimed land

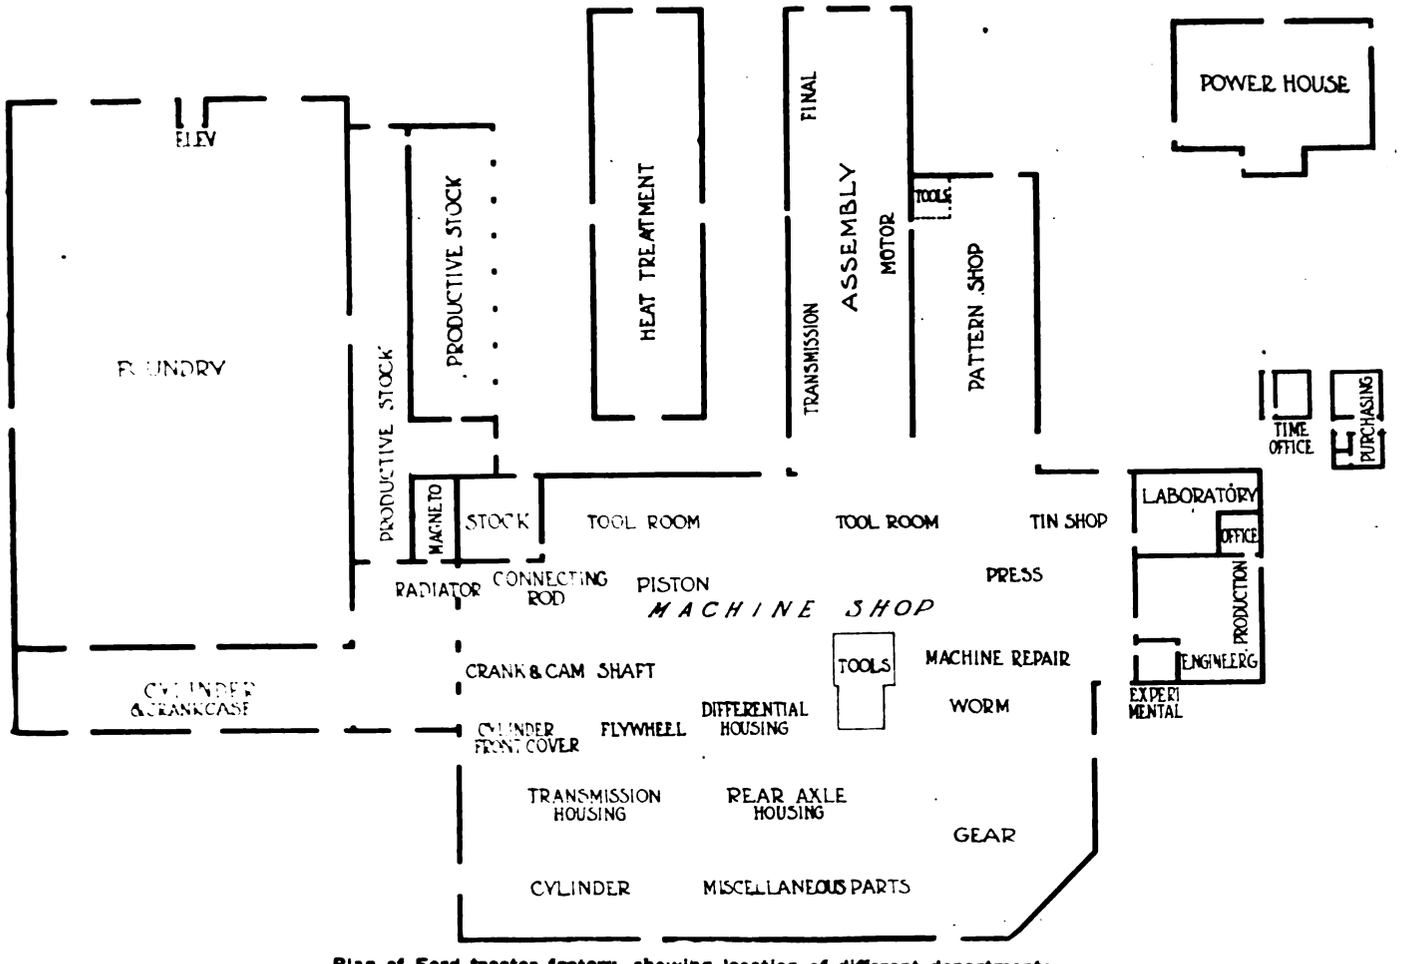


Digitized by Google

the new office building surrounding it is nearly completed, the roof will be lifted off the small building and a ceiling placed on instead, so that what now is a complete little unit in itself will become but a small part of the large administrative building.

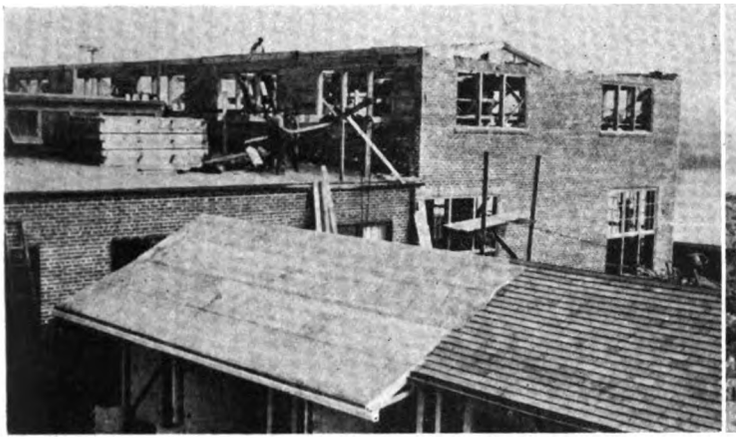
This example of what is going on with the little office building is only a repetition of what has been taking place with whole factory departments, and yet the basic scheme of production has not been disturbed, but has, rather, been developed during the changes.

How big the plant will be when it is finally completed the officials of the company do not know at the present time, nor does Henry Ford himself. The factory will continue to grow in proportion to the demand for tractors, and as it is impossible to conceive what this demand will be, it is also impossible to conceive the future developments of the tractor plant at Dearborn. Here Henry Ford owns a tract of land of several thousand acres, a large part of which is valuable farm land, plowed, cultivated and harvested by the tractors produced in his plant on the field acreage, so that there is plenty of room for expansion.



The layout of the plant, as would be expected, is progressive. The elaborate conveyor systems of the Ford Motor Co., which have become famous all over the world, are missing, as the necessity of rearranging the floor space has precluded the possibility of using any elaborate conveyor system at this early date. This will come in time, but at present more elementary methods of conveying materials from one part of the plant to another are used. A large part of the work is done outside at the present time. For instance, the big castings which form the central part of the tractor and act as a housing for the gears and a part of the final drive, are made by

Map of buildings, loading platform and railroad sidings



the Ferro Machine and Foundry Co. of Cleveland; and similarly a great many other concerns contribute some of the raw and fabricated stock employed in the manufacture of the tractor. Eventually, all these parts will probably be made under the roof of Henry Ford & Son's tractor plant, and even now, in spite of the fact that production only started about the first of last September, a well-rounded-out manufacturing plant has been developed, with up-to-date methods and machines in every department.

A general layout of the plant is given in the drawing

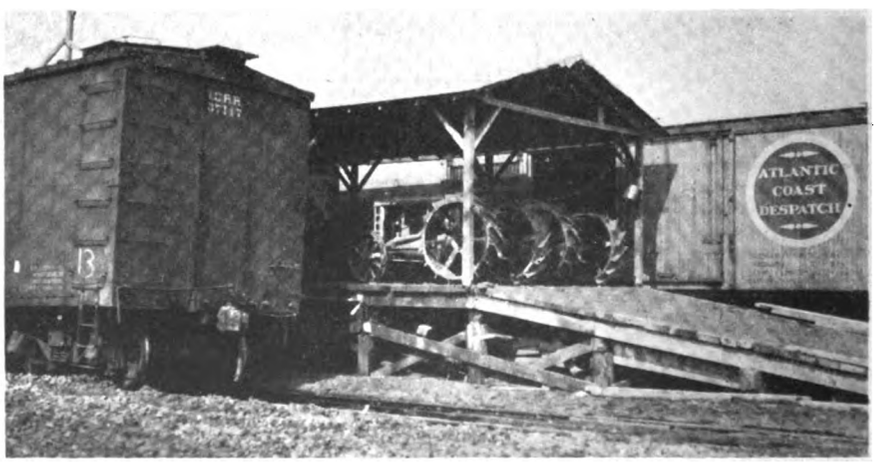
Plan of Ford tractor factory, showing location of different departments

Digitized by Google

It took less than 3 weeks to put up the brick structure shown here. This is part of the new office building

The tractors are useful in hauling the building materials through the mud roads, which would be impassable for an ordinary truck

herewith. This shows the relative positions of each of the buildings and also indicates the location of buildings now under construction and planned for the future. The drawing shows the layout of the machinery and departments of the present Ford tractor plant. The plant runs parallel to the Michigan Central Railroad tracks, which are also shown. As will be noted, there is a double siding with a dock between them, along which the plant extends. Afterward there will be other sidings brought in on the opposite side. The street marked Elm Street on the map is the only entrance. Along this street are arranged the offices, with the plant extending behind them. As the manufacturing arrangements are now laid out, the raw material works up from the back of the plant into the machine shop, which occupies one side, and from there it passes into the assembling department on the opposite side, after which it is led directly to the railroad. A large foundry building at the rear end of the factory is really the starting point of production. A great many of the castings used in the tractor are made in this foundry, and the remainder are bought outside and placed, after their arrival, into the productive stockroom, which is shown adjacent to the foundry building.



Both the castings produced in the foundry and those which come from outside plants are placed in the productive stockrooms, to be drawn upon for manufacturing purposes. Along one end of the foundry is the cylinder department, which forms the connecting link between the foundry itself and the machineshop. As the map shows, the roughing operations are carried on at the back end of the machineshop, the parts working up progressively toward the front of the buildings and then across into the motor and tractor assembly room. The cleaning operations are performed in that part of the foundry building which is adjacent to the machine-shop, and here the equipment includes snagging and disk grinders, benches, tumbling mills and the cylinder department. In the cylinder department the rough milling operations are carried on, the cylinder blocks being milled at top and bottom and both sides, the cylinder head milled off to shape, and the crankcase likewise, on heavy milling machines.

The cast top tank of the radiator and various medium-sized parts are taken care of in individual departments. It will be noted from the map that the departments are individualized throughout. There is a department for the radiators, another for connecting-rods, transmission housings, cylinders, differential housings, worm wheels, etc. These are clearly indicated on the drawing herewith, which shows the relative arrangement. The tool crib and tool-inspection department is centrally located in the machine-shop, where it is possible to supervise the tools and machinery on the entire floor.

(*Continued on page* 662)

The former administrative building for Henry Ford & Son. This is an old farm house which was converted into an office building and used up to a few weeks ago

Further Suggestions for Selling Liberty Bonds

Hints for Going About a Liberty Bond Campaign and for Carrying Out in Detail the General Scheme Previously Described

IN carrying out the Liberty Loan Drive in an industrial plant, the benefit of co-operation of the local committee having the work in charge should always be secured. The state or city committee always has available a number of good speakers which it can furnish for this work. It would be an excellent idea for the bond sales executive to have one of these speakers come to the plant each week and make it compulsory to attend a meeting at which this speaker addresses the employees.

It does not suffice to have the men in the organization be the only ones to talk Liberty Loan to the employees. The newspapers of the city in which the plant is located should be apprised of the fact that a Liberty Loan Drive is in progress at the plant. They will be glad to get this news and will publish the results of the drive. They can

Editor's Note—Last week AUTOMOTIVE INDUSTRIES *gave an extensive outline of how to conduct a Liberty Loan campaign. In the following some further hints are given on means for carrying out this work.*

Digitized by Google

be kept informed as to what is taking place by putting them on the list to receive the daily bulletin which should be published in accordance with the plan given in AUTOMOTIVE INDUSTRIES last week.

Throughout the factory, score boards should be displayed, telling the percentage of its quota attained by each department. It would be an excellent idea—if the departments are all equally divided—to offer a prize to the members of the winning department, that is, the department which exceeds its quota by the greatest percent. Nothing better could be found for the prize than a book of thrift stamps or a war savings certificate stamp. This would act not only as an incentive but would help swell the receipts of the Government.

If it is not possible to have a speaker address the entire organization at one time, let him divide his time so that he addresses different individuals at different times, or get two or three speakers and divide the organization up between them. There will be no difficulty in securing the speakers, as the local committees are gathering and have already gathered numbers of them to aid them in just such work.

Meeting of Committees

When the committee from the local organization calls at your plant, they will meet, if the plan is followed out, an organization which has already done the work for them. It would then be a simple matter for them to assist the factory committees to sell their own campaign, so that the industrial organization is given full credit for its work, and the employees can feel proud that they are working for a concern which has the interest of the country at heart to such an extent that it will go to the trouble to plan and carry through the drive in such a thorough manner. These are a few suggestions which will come up when the drive is being organized. If they are put into use, every employee of the factory will be approached in several different ways.

First *his eye* will perceive the posters and display cards which will be distributed all over the plant to focus his attention on the drive.

His ear will be caught by the speeches of the 4-minute men and other committee speakers that will be relied upon to a large extent to carry out this drive.

Personal contact will be established by the bond salesman who will call, not once, but many times on each person who is a prospect for the bonds, and this means practically every man and woman in the business organization.

His interest will be aroused by the daily newspaper or bulletin gotten out to spread the spirit of the drive and to indicate its progress.

His sporting instincts will be be aroused by the offer of prizes and by the friendly rivalry with other departments.

His patriotism will be appealed to by the speakers, by posters, and by the implanting of the knowledge that money alone can win the war and that the Liberty Loans are the easiest way to raise the money because they do not take anything from the pocket of the contributor that will not be repaid with full interest in due time.

Automobile Engineering Bureau of Information

COVENTRY is the largest center of the British automobile industry and occupies somewhat the same position in England as Detroit in this country. At the public libraries of such cities there naturally is a strong demand for all sorts of automobile literature, as well as scientific literature having a bearing on the construction of automobiles and parts.

A plan for collecting a comprehensive library of automobile engineering information, and to establish a sort of information bureau for the industry, has been worked out in Coventry and was described in a paper read before the Institution of Automobile Engineers recently by Ernest A. Savage, chief of the Coventry Public Libraries.

Suggestions for Collecting Automobile Literature

In outlining a scheme for collecting and classifying automobile literature the author laid it down that there should be basic books on pure science; text books of summarized practice; periodicals dealing with progressive theory and practice; matter dealing with progressive practice in small material, including trade catalogs, etc.; books on collateral subjects, and guides to literature in the form of bibliographies, indexes, abstracts and digests. Thus, it will be seen that such a Bureau of Information for the Automobile Industry must comprehend all information which can in any way be useful to the industry. The principles of collecting, in the author's opinion, were that the bureau should take into account all material which suggests new processes of manufacture, or developments of them, or gives early news of such processes which help to eliminate technical troubles in manufacturing, which indicates new uses for articles already manufactured, which makes it possible to compare specifications for raw materials and methods of testing, which describes quicker and better methods of production and organization, or which takes account of the organization and aspirations of labor, its welfare and conditions of living. Finally, some provision should be made for the study of science for its own sake. It is suggested that such a bureau should be in the hands of a man librarian with engineering knowledge, or an automobile engineer.

Conceived as a reserve bureau, such a bureau of information should possess ample resources in works of research which could not be bought by any special bureau or by any public library. This bureau should be organized, say the originators of the idea, to serve the whole industry, by forming a library of English and foreign books and periodicals —difficult to obtain when needed—of pamphlets, articles, prints, drawings, and information of all kinds. It should publish a bibliography and a periodical index to scientific literature.

The first thought that arises in connection with such a scheme is cost, but the author does not think it would be high. He contends that all the component parts of the bureau already exist in the number of very large libraries, either wholly belonging to the State or enjoying State privileges, which are not being employed to their full capacity and might reasonably be called upon to found a central bureau of information or lending library.

In support of his case, Mr. Savage quoted the International Institute of Bibliography in Brussels, founded in 1895, with the twofold aim of answering, for moderate fees, all inquiries for bibliographical information and of compiling a universal bibliography. Attached to the Institute is the International Office of Bibliography, which is responsible for a cooperative catalogue or book directory of the Belgian libraries. At the outbreak of the war, the Universal Bibliography consisted of an index of about eleven million cards. There is also the Library of the United Engineering Societies, in New York, to which is attached a bureau of information. Reference was also made to the utility of certain bureaus of commercial information on the Continent and in America in support of the scheme for a Central Industrial Information Bureau in this country, with which would work in some form not defined by Mr. Savage local bureaus in industrial centers, on the lines of that now existing at Coventry.

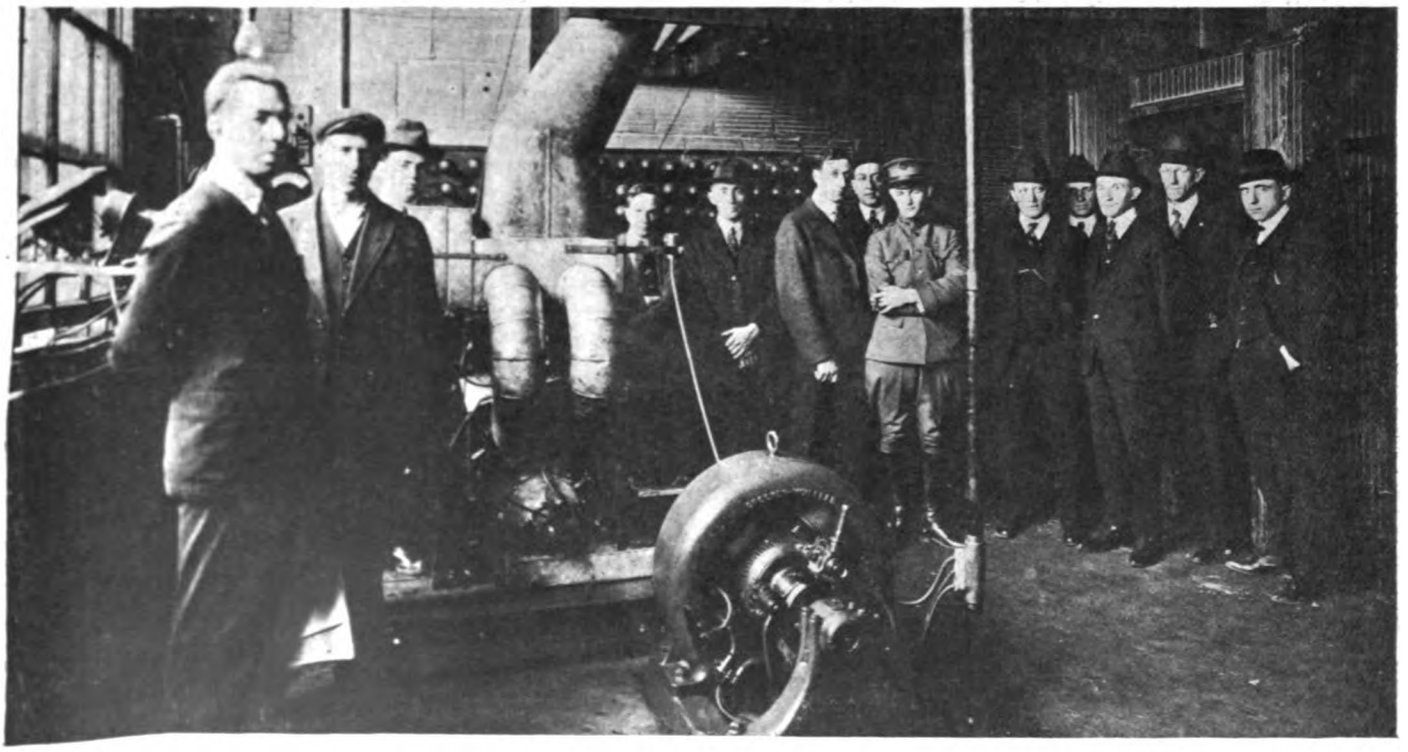
Electric Lighting System for U. S. A. Motorcycles

Tests Prove Possibility of Controlling Voltage Without a Battery in Circuit — Graphs Show Voltage Regulation and Relative Steadiness of Light Throughout a Wide Range of Engine Speeds

By P. M. Heldt

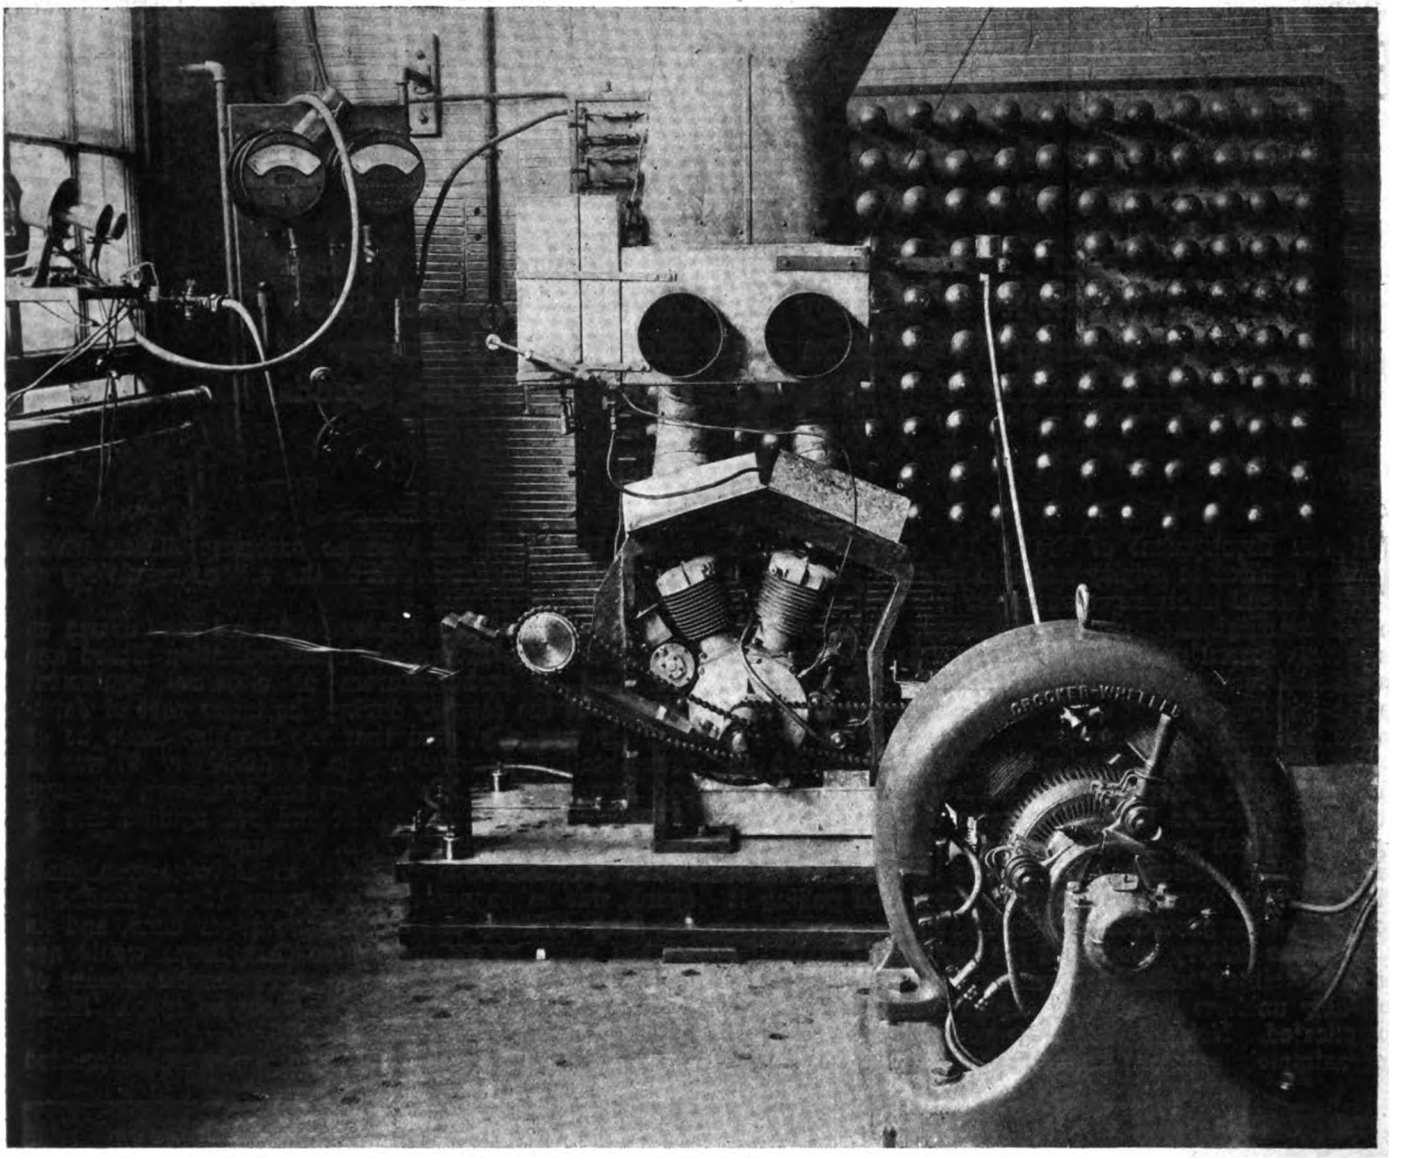
IN the development of the U. S. A. motorcycle it was decided to employ magneto ignition and also to fit a small electric generator for generating current for electric lighting. No storage battery is to be used, as it was feared that the motorcycle riders in the field would not be in position to give the necessary attention to the battery and that under these conditions a battery would inevitably give trouble.



Consequently, the lights will have to be hooked up directly to the generator. Heretofore in practically all automotive electric lighting systems a storage battery has been floated on the line; such a battery has a powerful steadying influence, boosting the line voltage when the generator drops below normal speed and pulling it down when the generator exceeds this speed.

With the battery eliminated the problem of maintaining the voltage sufficiently constant so as to insure a tolerably uniform light at all engine speeds is seriously complicated. Not only must the voltage be maintained approximately constant throughout the generator speed range, but there must be no excessive flicker which might be due to the action of the voltage regulating or control device.

Specifications of the generator desired were drawn up by the Military Motorcycle Standardization Board and submitted to manufacturers of electrical equipment throughout the country during the latter part of January. It was stipulated that the machine must be of round section, not over 3¾ in. in diameter. It was to be clamped to a saddle cast on the crankcase, telescope into the driving gear housing and bolt against this by means of three ¼-in. 28 S. A. E. screws.



The generator was to be driven at twice crankshaft speed, was to supply current to one 15-c.p. headlamp, one 2-c.p. taillamp and one 2-c.p. side-car lamp, and its voltage must be maintained so that lamps would not blow under any circumstances. A reasonable amount of light must be given at 500 r.p.m. engine speed. Shaft and dimensions were also specified.

Four manufacturers of electrical equipment submitted

Test set-up for tests of generators for the U. S. A. motorcycle

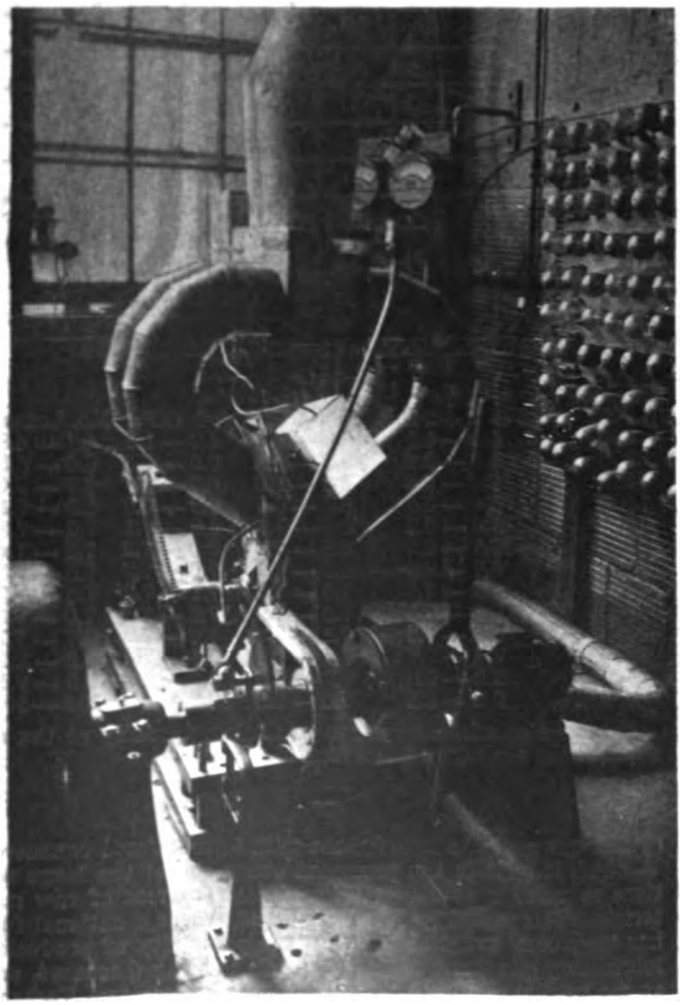
generators for tests and had representatives on the scene when these tests were made. We will designate the four machines by the letters A, B, C, and D.

Generator A is 3 7/32 in. in diameter and weighs about 6 lb., including its control mechanism, which is inclosed within the generator housing. Control is by a regular voltage regulator, comprising a magnetic vibrator, shunt coil for operating this and a field resistance which is cut in and out by the vibrator. This regulator operates in conjunction with a third brush system. The regulator resistance is located at the commutator end of the generator under the cover. As all of the regulating devices are inside the generator and the latter is wound for a ground return wiring system, there is only a simple binding post or terminal on the outside.

A somewhat different control system is used on generator B, which is 3 7/16 in. in diameter, 6¼ in. in length over all and weighs 7¼ lb. Like type A it is of bipolar construction. The regulating mechanism comprises a vibrator with two contact points. One of these contact points is vibrated by means of a cam, or rather an eccentric on the end of the armature shaft, while the other contact point is drawn away from the vibrating one by an electromagnet energized by a coil connected across the armature. The higher the voltage generated the more the contacts are kept apart by the electromagnet and the less the field resistance is cut out. High speed of the cam also tends to reduce the time of contact and thus to keep down the voltage. This regulator is mounted on the end plate at the commutator end.

Generator C has a straight voltage control. However, the control resistance in the field circuit is divided into two parts and there is a double vibrator, so arranged that when it is actuated moderately only one contact set will open and one part of the resistance be cut into the field circuit, whereas if the actuation of the vibrator is more energetic both contact sets will open and the whole of the resistance will be cut into the field circuit. This generator is of four pole construction with series armature winding so arranged that the two brushes come on top of the commutator. The machine is 3¾ in. in diameter and weighs approximately 10 lb. with regulator.

Generator D is 3 7/16 in. in diameter and weighs 9.8 lb. It is of four-polar construction with series wound armature, one brush being at the side and the other at the bottom. The regulator is of the usual vibrator type and is located in a circular housing on top of the generator, which can readily be removed if desired. As all of the screws holding the end plates in place are lead-sealed, the generator cannot be tampered with. The armature is coil wound and impregnated with Bakelite.



All of the generators are fitted with ball bearings. All

Digitized by Google

were successively installed on a U. S. A. cycle motor, connected to a load consisting, first, of one 12-c.p. headlamp and a 2-c.p. taillamp, then of one headlamp and one taillamp and finally of one taillamp only, and the engine with each of these loads was run at various speeds from 500 to 3600 r.p.m. At each speed ammeter readings were taken and the character of the light given out by the headlamp was noted. The ammeter hand would not stand steady but swing more or less and the extreme points reached in its swings were noted.

It may be pointed out that these tests will not be the sole basis for selecting one or more types of generator for use on Liberty motorcycles but are preliminary to extended road tests. The object was to test the generators on the engine to which they are to be fitted throughout the whole speed range and bring to the attention of the makers at the earliest possible moment any possible defects in design, so that these might be remedied before the final tests are begun. It was realized that the design of a variable speed, variable load, constant voltage generator is a comparatively new problem and that perfection would not be attained immediately. The results shown by the tests are, however, quite encouraging and there is no doubt that a thoroughly practical outfit will be secured.

The results of the tests are given in the accompanying tables and curves. In plotting the curves the mean of any pair of voltage readings was taken. On full load very good results were obtained with three of the generators—A, B and C. Generator D, with plain vibrator voltage control, gave a rapidly increasing voltage above 2400 r.p.m. engine speed. The reason is believed to be that from about this speed the vibrator keeps the field resistance in circuit all the time so that the voltage rises with the speed.

Another view of the test stand

Generators B and C also showed up well on the slightly reduced load—headlamp and one taillamp. The voltage of generator A dropped away rapidly from about 2000 r.p.m. engine speed on.

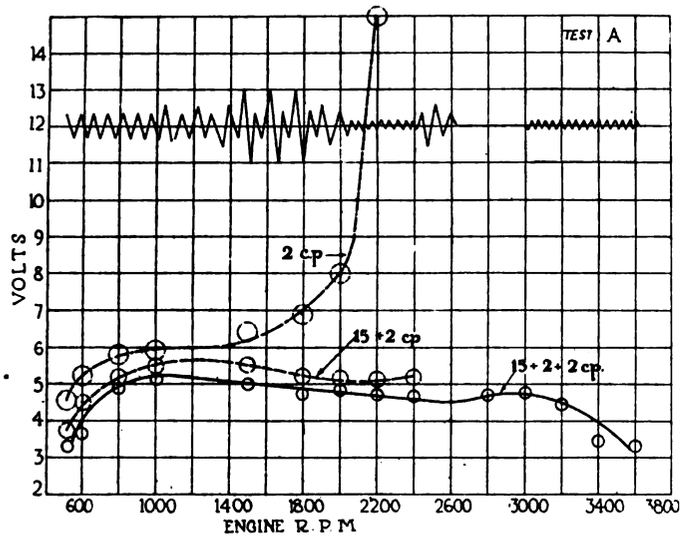
When loaded with only a single taillamp, generators B and C again maintained their voltage quite well throughout practically the whole range of engine speed. At the upper end of this range both increased considerably in voltage, that of generator C reaching 10 volts at 3600 engine r.p.m. This speed would never be attained by the engine in riding, so that this sharp rise in voltage, which is further contingent upon only a single 2-c.p. lamp being in circuit, is of little importance.

The voltage of generator A when applying only one taillamp takes a sharp upward turn at about 2000 r.p.m. engine speed, and this speed could not be much exceeded without burning out the filament. The same trouble occurred with generator D. In the case of generator A, the probable reason is that since its control is based in part on the constant current principle (third brush regulation) when the lamp load is greatly decreased too much current will flow. Generator D probably has too small a field resistance.

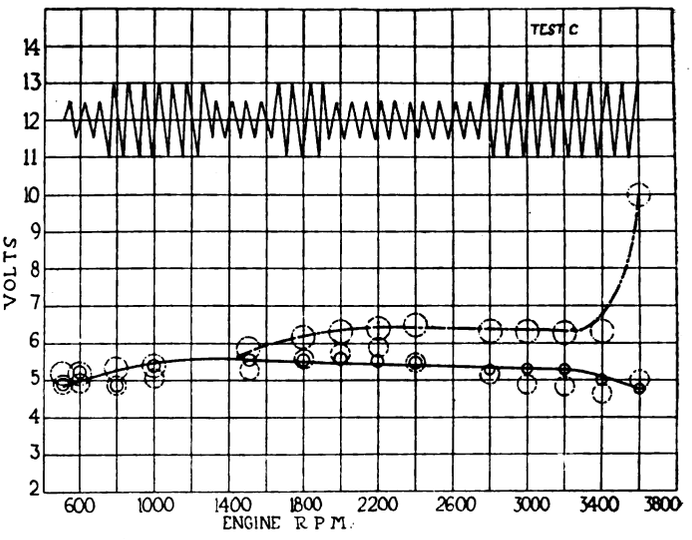
The above observations relate to the variation of the voltage with engine speed and generator load. Preferably this variation should be nil, but in practice such a result is unattainable. Too low a voltage, of course, means a dim light, while too high voltage means the burning out of bulbs.

Character of Light

Beside the gradual variations in voltage due to variations in engine speed there are rapid variations which may result from the action of the voltage regulator or from engine vibration. Such rapid fluctuations in voltage result in a flicker or in periodic variations in the intensity of the light, which under certain circumstances may be quite annoying. As the test runs with full lamp load were made, an observer noted the character of the light given out by the headlamp, and in the diagrams the character of the light is denoted by symbols.



As will be seen from the illustrations, the tests were made on a test stand, the engine driving through a chain to a jackshaft to which an electric generator could be connected by means of a friction clutch.



In connection with the set of curves marked D it should be pointed out that the regulator of this type generator was disabled as soon as the tests started and the representative then secured a shock regulator as used by the manufacturer on automobile equipments. The result was that regulation was rather unsatisfactory.

*This series of observations was taken specially at the request of the maker's representative.

—

THE war and the interference with international commerce which it entails has prompted every one of the large nations to make a survey of its national resources of raw materials. This is being done in England, where a national fuel has long been sought for. Now the possibility of producing lubricating oils from native materials is being discussed, and at the next meeting of the Institution of Petroleum Technologists a paper dealing with an important aspect of the subject will be read.

Traction on Bad Roads or Land*

Part III

Classification of Tracklayers—Truck Frames and Track Frame Connections—Methods of Steering Tracklayer Tractors—Power Plants

By L. A. Legros

THE various track systems may be classified as follows:

(a) Feet or sections laid by a wheel; the girdle form, of which Boydell's tractor, the ordinary girdle, and the early Pedrail, are examples.

(b) Chain-track supporting rollers with axes fixed relatively to the truck frame by which they are carried; examples of this are the caterpillar (Holt), Creeping-Grip (Bullock), Tracklayer (C. L. Best), Clayton, Strait, Cleveland, and others.

(c) Chain track supporting through secondary chains of traveling rollers arranged as intermediate chains between the truck or sledge, and the track or lag chain; examples of this are the Log-Hauler (Phoenix) steam tractor for snow and ice, the Centiped (Phoenix) tractor for soft ground, the Allis-Chalmers and the modern form of Pedrail (Diplock).

(d) Chain track supporting by rows of traveling balls, as in the Ball-Tread (Yuba) tractor.

Apart from the girdle, sometimes fitted to hauled vehicles, there is no modern representative of extended application of tractors of Class (a) known to the author.

The chain-track tractors that are constructed and used in the largest numbers, both as to makes and output, are those with rollers revolving on axes fixed to one or more truck frames for each track, Class (b).

It appears that chain tractors for the haulage of lumber were made and used commercially in the United States as early as 1904, and some of these early tractors are stated to have been still at work last year; these vehicles are fitted with the intermediate roller chains of Class (c).

Tractors in which the load is transferred from the chain to the track frame by rows of traveling balls, Class (d), are represented at present, so far as the author is aware, by the single example of the Ball-Tread (Yuba).

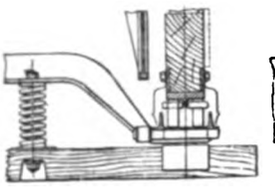
Methods of Springing

Four distinct systems of springing have been tried or are in use:

(e) Foot springs: In this method the springs are interposed between the actual foot and the carrying portion. Examples are the old and new forms of Pedrail (Diplock).

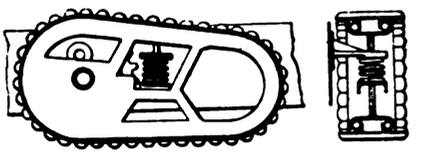
(f) Track wholly spring supported, the axle of the track frame being carried on springs: Centiped (Phoenix) and Allis-Chalmers.

(g) Track partly spring supported: Caterpillar (Holt), and Clayton tractor (totally over effective bearing portion).



(h) Track pivotally sprung: Tracklayer (Best), Strait tractor (Killen-Strait), and Ball-Tread (Yuba).

Owing to many constructional difficulties direct springing of the feet, Class (e), has not yet taken a prominent place among commercial chain-track tractors.

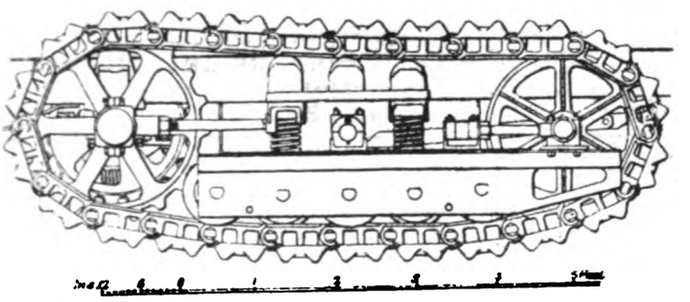


The methods of track springing are intimately associated with those adopted for insuring equable load distribution on the chain.

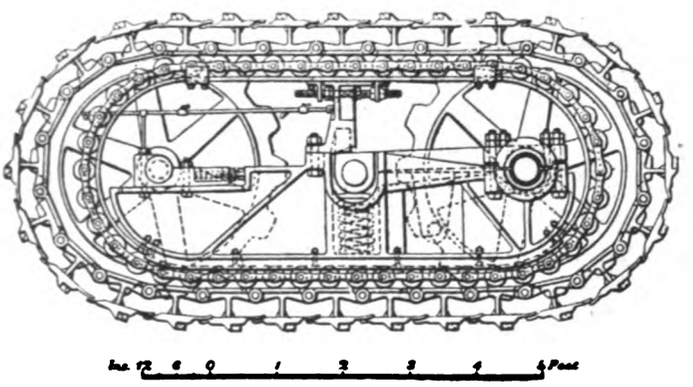
The method of supporting the vehicle on springs carried on the track axle, Class (f), requires either a chain or a cardan drive to permit driving when the springs are unequally loaded, as when crossing ditches or running on side-lying ground.

In some vehicles of Class (g) the whole of the effective portion of the track is capable of vertical movement, as in the Clayton tractor, in which a link connects the single truck frame to the track frame. In others the truck is in one or more parts controlled by linkwork from the back of driving-sprocket axle, a practice followed successfully by the Caterpillar (Holt).

Modern Pedrail foot and rail (Diplock)



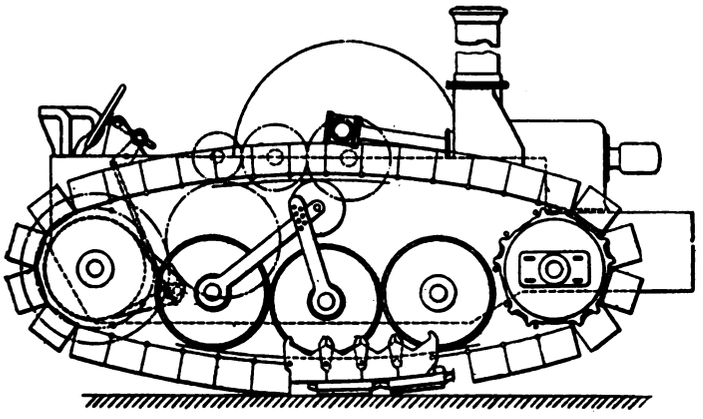
Chain track with rows of traveling balls (Yuba)



In other tractors having chain-driven sprockets the whole of the track-frame is capable of pivoting about a central axle, an arrangement which is adopted in the Creeping-Grip tractor, or the track-frame may be pivoted and sprung about the axle of the driving sprocket, as in the Tracklayer (Best), and the Strait tractor (Killen-Strait). These two arrangements, though very different in appearance, are both equivalent to partial springing of the track, Class (h).

The various methods adopted for distributing the load of the tractor over the chain-track elements may be classified as follows:

(j) Truck frame and track frame identical; this arrange-



Chain track partly spring supporting (Caterpillar)

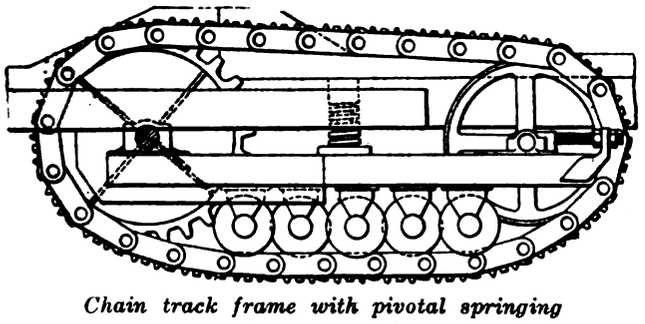
Roberts tractor illustrating nut-cracker action

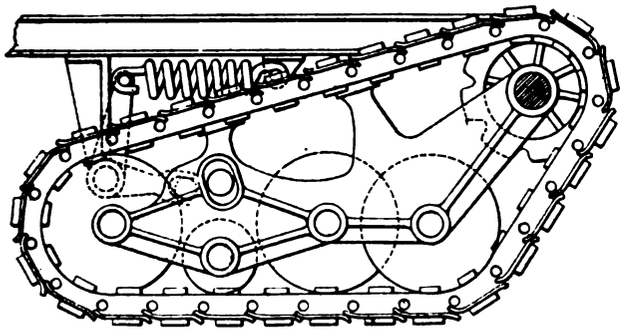
Details of Roberts chain track

ment is adopted in the modern form of Pedrail, in the Strait, Log-Hauler, Centiped, Allis-Chalmers, and Ball-Tread.



(*k*) Truck frame integral with track frame; this form of construction, which very closely resembles the preceding, is adopted by the Tracklayer, and Creeping-Grip.

(*l*) Truck frame in one piece connected by a link or guides to the track frame; this method is used in the Clayton tractor.



(*m*) Multiple truck frame articulated and connected by links to the track frame; this is adopted in the lower-powered Caterpillar, and enables the load on the chain track to be distributed over irregular surfaces to which the chain track and truck frames can adapt themselves under the action of the springs.

When the track frame is pivoted to the main framing, the whole length of supporting surface of the chain track is capable of adapting itself to long undulations or irregularities; this arrangement is therefore very suitable for use on ordinary ground, snow, ice, sand or marsh. The articulated truck frame, on the other hand, permits a more even distribution of load over the chain-track elements when passing over small irregularities such as stones, rocks, railway ties, rails, etc., and for this reason is better adapted for haulage from railhead into country in which rock crops out.

The arrangements adopted for steering vary considerably. In several models, of which the Centiped and Creeping-Grip are examples, there are steering wheels with steering of the ordinary Ackermann type; in others the practice is to use a single steering wheel, as in the Caterpillar (Holt, 75 hp.), Clayton and Ball-Tread (Yuba). The steering wheel of the Clayton is fitted with an elevating gear, so that it can be raised out of action for turning small circles. In the Strait there is a small steering chain track; in some of the lower-powered tractors—Caterpillar (Holt, 45 hp. and 18 hp.), Baby Creeping-Grip (16 hp.) and F. C. Austin (35 hp. and 15 hp.)—the tractor is carried entirely on the two tracks, and steering is effected by releasing the clutch on the inside of the curve to be taken, and driving only on the outside of the curve. In the Burford-Cleveland a brake is applied to one side and the other is driven at increased speed through the differential gear. With some tractors, the Ball-Tread (Yuba), for example, it is possible to turn the machine about its own axis, by reversing the driving direction of one of the chain tracks.

Chain track frame with pivotal springing about rear axle

Chain track frame with pivotal springing about end bearing

It is obvious that there are four methods available for securing steering of tractors carried on two chain tracks only; one by the use of the clutches alone; another by supplementing the clutch action by that of a brake acting on the appropriate side; a third by the use of the brake on one side and the action of a differential gear; and the operation of an independent reversing gear to each track gives a fourth method. In the majority of the designs under consideration it is possible to turn the machine in a circle of about 15 ft. to 20 ft. radius, and in some of the small tractors the turning circle is only 6 ft. radius.

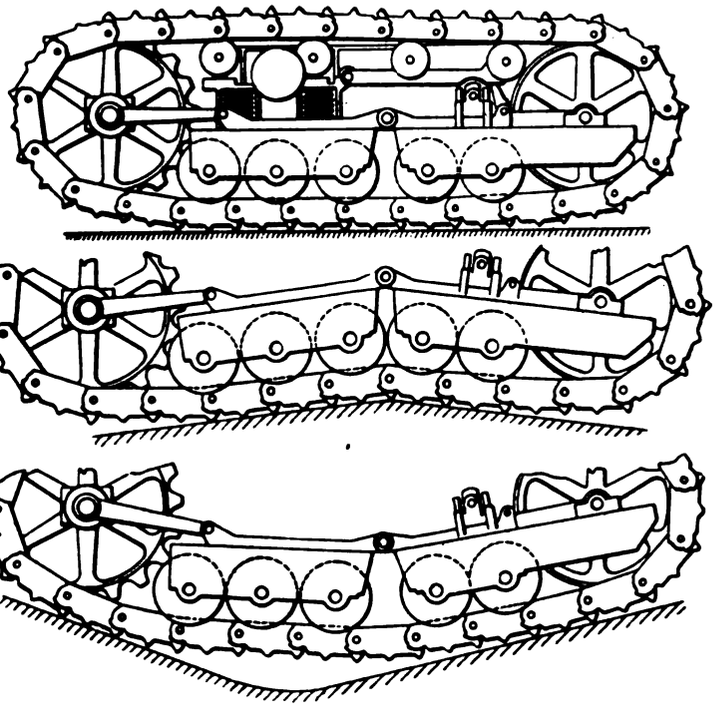
In the Log-Hauler (Phoenix) steam-driven tractor, for use on snow and ice, runners are fitted for steering; these can also be arranged with some of the other types described when required to work under winter conditions.

Driving Gear

The drive of some tractors is fitted with a differential gear; this is usual where there is front-wheel steering, as in the Creeping-Grip or Centiped (Phoenix). In those machines in which steering is effected by declutching one or other of the tracks it is not usual to fit a differential; where, however, the steering is effected or assisted by independent clutching or braking of the tracks, as in the Clayton tractor and in the Burford-Cleveland, a differential gear is fitted to the main drive between the tracks.

The driving gear generally comprises a main clutch and a change-gear box of somewhat similar pattern to that used on motor lorries and trucks. The number of speeds fitted varies. In one instance, the Allis-Chalmers, there are four forward speeds and a reverse; in a few tractors three forward speeds and a reverse are fitted; two forward speeds and a reverse are more usual; very rarely, as in the high-power Caterpillar (Holt, 120 hp.), only a single forward speed and reverse is ordinarily fitted, the two-speed gear being an alternative arrangement.

Chain Tracks



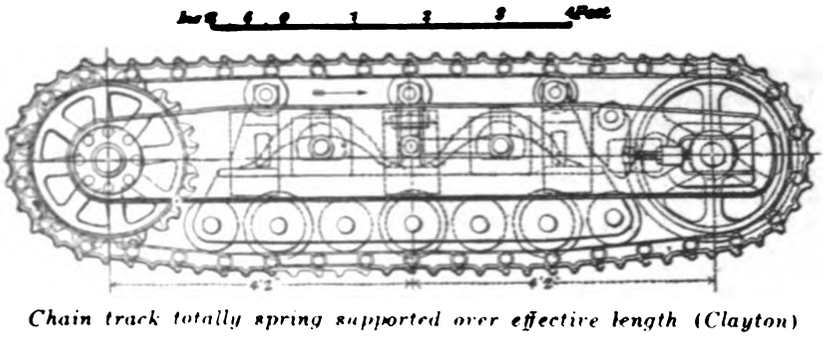
The design of the chain track itself is one of the most important factors of the success or failure of the tractor. The chain track is usually driven by a sprocket at the back end, and passes round an idler at the front carried on the track

Digitized by Google

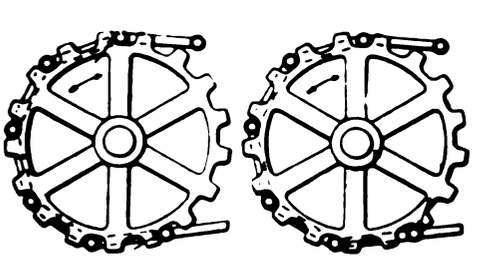
frame and engaging only laterally with the chain track by a central flange or flanges; the idler axle is usually fitted with an adjustment for taking up wear of the chain track. It will be noted from the cross-sections shown that the width of the track is greater than the width of bearing for the rollers, and any hard object, rock or rail, encountered by the chain may therefore tend to load it unequally, and subject it to torsional stress. Furthermore, if the chain track passes over a hard and narrow object, such as a railway rail, this will tend to produce reverse curvature in any unsupported portion of the chain. This is the case where the chain has a short free length between the leading idler wheel and the first pair of carrying rollers. Realization and over-estimation of these difficulties were probably responsible for the early designs of chains made in this country. The links were so arranged that the connecting pins were raised several inches from the ground, and the blocks, of which the chain track was composed, were so made as to butt against each other when the chain track was in the position of minimum curvature. In this way the bearing portion of the chain track formed an inverted arch, which was supported at portions of its length by the rollers, and depended on contact between the links for carrying the load on intermediate portions of the chain.

In order to reduce the stresses still further, and to relieve the chain pins of the heavy load to which they would otherwise be subjected, interlocking extensions above the pins were formed on the chain links. Unfortunately this method of carrying the load resulted in the introduction of new and greater difficulties, generally known as nut-cracker action. If the track worked only on sand or mud, or even on pure clay, there would be no difficulty; but where there is a combination of stones and clay or when, in crossing gravel or roads, any hard object can be picked up by the track and get between the bearing faces of the links, the stresses so caused become excessive and the track may even become jammed. This result can be caused also by pieces of fencing wire or scrap iron such as may occasionally be picked up on a farm. In the forms of chain track now commonly used the pin centers are brought as close to the ground level as possible, and the chain plates are so formed as to shield the opening between the track plates over the working range.

The second source of trouble to which chain tracks are subject is that of stretching due to wear. This lengthens the pitch of the chain and necessitates fitting and adjusting gear to take up the slack; it also tends to cause riding on the driving sprocket. As it is usual to pitch the chain pins so widely that they will engage with alternate teeth of the driving wheel, when cut as an ordinary sprocket, this wheel should have an odd number of teeth in order to distribute the wear uniformly over the whole of the teeth.

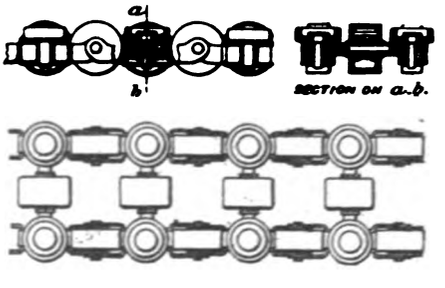


Multiple articulated truck frame (Caterpillar)



The chain-track links have three functions to perform:

1. Carrying the load.
2. Affording the necessary resistance for traction by engaging with the ground surface, and
3. Providing the gearing pin, or its equivalent in tooth form, to engage with the driving sprocket.



The first condition involves a machined surface, preferably hardened, for the carrying rollers to bear on. The second condition necessitates an irregular outline of the lower surface of the link, so that it can gear with the ground surface as a large pinion would gear into a rack; hence the form of shoe must approximate to a ribbed section, and is usually of pressed steel. The third condition requires that the pin joints or gear faces shall be machined accurately enough to work smoothly with the driving sprocket without risk of riding on its teeth. These three conditions, coupled with the proximity of the connecting pin to the ground, have limited the best designs to built-up forms of construction in which the actual link is a machined steel casting riveted to a pressed steel sole plate. The conditions of running require that this plate shall be of such form as to clear the end of the next plate throughout the range of inclination to which the links are subjected, and that over the same range there shall be no opening between the plates, in which nut-cracker action can take place. The troubles due to stretching can be forestalled, as was shown by Hans Renold about twenty-five years ago, by making the pitch of the driving wheel large in the first instance, so that the chain track is driven, at the beginning of its life, from a tooth nearly opposite that which is entering into engagement with it. By these means a fairly long life can be assured to the chain, provided it is not overloaded, and that efficient lubrication is maintained. The usual method is to supply a large amount of low-grade oil to the in-

side of the chain; an oil drip so fitted to the side chains of certain early-pattern motor cars (1900-1902), which ran under almost identical conditions of mud and dust, has proved almost as efficient in preserving the chains as frequent removal, washing in paraffin, drying and soaking in a bath of warm tallow and plumbago. Cheap oil used lavishly appears, in fact, to keep the tracks from cutting or seizing even under very bad conditions. In the Tracklayer (Best) a different methed of providing against wear is adopted, the pin being made of rocker form.

Another matter that affects the design of the whole chain track is that of the permissible sag. The chain is supported laterally by the sprocket teeth at the back end and by the idler rim at the front end; over the intermediate parts it is only supported by the flanges of the supporting rollers. As the flanges of these rollers are limited for size by the closeness of the bearing surface to the ground, it will be seen that the permissible sag which may occur when crossing holes in rough ground is not very great. If supported at the ends the suspended portion of chain hanging freely will assume a curve which approximates to a catenary. For such a crude approximation as is afforded by the few suspended links of the chain track, the curve passing through the centers of the pins is very nearly a parabola; if the curvature is small, this in turn approaches a circular arc. The worst condition for the chain occurs when there is a combination of steering and backing on rough ground; this may at the same time cause slackness in the carrying part of the chain combined with sideway thrust due to steering, and in some of the forms of construction described the roller flanges may be caused to ride on the chain surfaces.

One method of dealing with the difficulty is that of giving a large camber to the supporting portion of the track. In a vehicle styled the "Centipede," built by William Foster & Co., Limited, the track was given a camber about equivalent to that of a 16-ft. wheel. In the majority of the tractors described the curvature of the supporting portion of the chain track is very small, corresponding to that of wheels from 90 ft. to 160 ft. in diameter, and in some cases even it has zero value, the part of the chain track on which the wheels run being laid flat. This necessitates care in keeping the chain track constantly adjusted for wear. It will be noted that this difficulty is not so serious in the chain tracks fitted with an intermediate chain, as both the chains can sag together, and it is possible to provide deep retaining faces to keep the intermediate roller chains in place.

Lateral Pressure

The lateral pressure on the chain track when the tractor is traveling on side-lying ground, or crossing ditches obliquely, is another factor that must be taken into account in designing the chain track as well as the truck frame and its connections. Under most conditions the sideway thrust is taken partly on the flanges of the truck rollers and partly on the flanges of the driving sprocket and idler. An arrangement which appears to provide specially for this condition is that of the Ball-Tread (Yuba). In this the whole of the lateral as well as the vertical pressure is transferred from the chain track to the track frame through the balls. Lateral load merely affects the angle of incidence of pressure on the ball without increase of friction. Diplock, in his recent developments of the Pedrail, has obtained the same result in a different way, by using a compound chain of rollers arranged alternately with axes horizontal and vertical, the track frame and bearing surfaces of the chain track being made with appropriate faces for receiving the vertical and lateral loads respectively.

For traveling on rough country and under general agricultural conditions the pressed steel shoe is found satisfactory. In this case the supporting surface for the rollers consists of a steel casting, or case-hardened drop-forging, bolted to the shoe; in other cases the track shoe and supporting surface

are formed in one as a single steel casting. Where the ground surface presents small resistance to shear or actually lubricates the shoes, as is the case with clay and chalk and some grass surfaces, it is sometimes found necessary to attach grousers or spuds of angle bars to the shoes by means of bolts. When the tractor is required to do hauling on ordinary roads it may be necessary to attach thin sleepers of hard wood to the shoes in order to provide a flat bearing and prevent damage to the road surface. Those chain tracks which present fairly flat surfaces to the road and are not excessively cambered—the lower-powered Caterpillars, Clayton and Burford-Cleveland for example—can be run over inferior roads with even less risk of damage than would occur with the ordinary driving slats of the common traction engine.

Engines

The internal-combustion engines fitted to chain-track tractors are generally of a type resembling that used for heavy truck work. There is no reason for great economy in weight, and indeed the weight of the vehicle must not be too small for the tractive effort; consequently cast iron is preferred to aluminum for the engine and also for the gearbox. A governor is usually fitted to prevent racing the engine. That care which is taken in designing the passenger car engine to obtain a flat torque curve, and which is accompanied by large diameters of valves, induction and exhaust passages, is not called for here. The torque curve consequently falls rapidly at a comparatively low speed. This, as is generally recognized by the makers of engines for commercial vehicles, is not without advantage, for when the resistance to traction becomes unduly heavy, owing to gradient or softness of the ground, and the speed of the engine is consequently reduced, the torque increases and the driver has a better chance of extricating the vehicle from its difficulty without changing gear than is the case with constant torque. A typical torque curve of one of these engines is given in the accompanying diagram. The tractor engine runs at a low piston speed, 600 ft. to 900 ft. per minute; that is, at barely one-half the speed usual for the passenger car engine. On the other hand, it is required to work at a greater percentage of its full power than is the case with the passenger car engine, and for considerations of fuel economy it should, in general, be designed to give its best efficiency, measured in brake horsepower per gallon per hour, at from 50 per cent to 70 per cent of its full rated capacity. In many instances the engines are designed to start on gasoline and to run normally on kerosene, or, in America, on "distillate"; this also implies a larger engine for the power than is the case where gasoline or benzol is the usual fuel.

Lubrication

Lubrication of the engine is usually insured by the splash system, but in some instances a combined splash and forced lubrication system is fitted. Separate oil reservoirs are of course required for the engine-lubricating oil and for the crude black oil used for the track chains.

The usual form of ignition is the high-tension magneto. Self-starters are not fitted, as they would involve too much additional complication. Owing to the large size of some of these engines, and the difficulty of starting by swinging the starting crank handle, a trip gear is arranged on the magneto which enables a strong sparking current to be obtained for a small movement of the cranking handle. This arrangement was used by the author in 1895 on gas-traction tram cars, the engines of which were started by pulling over the flywheel. The combined use of gasoline for starting and kerosene for running complicates the carbureter and piping arrangements slightly, and involves fitting an extra tank,

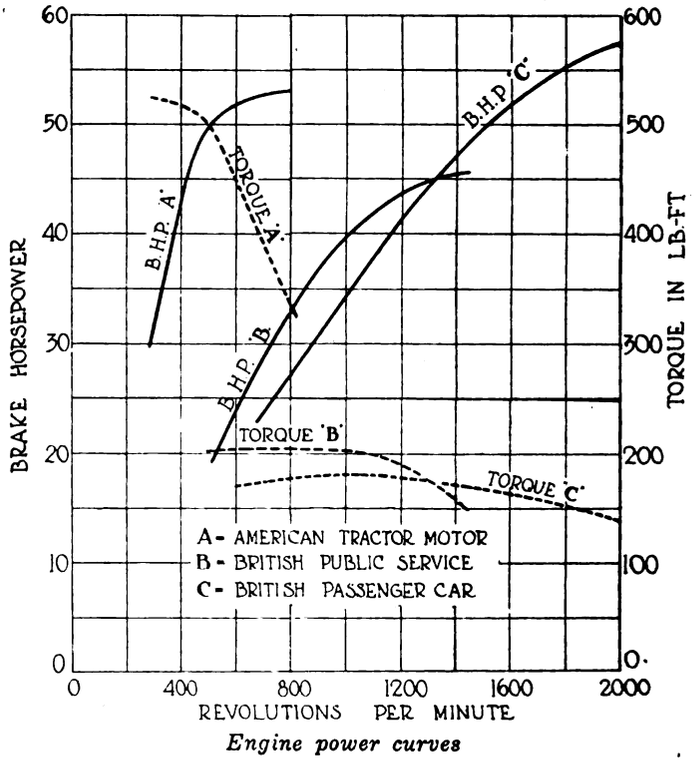
but the advantage of ease in starting is well worth this.



The radiators of chain-track tractors have been designed to meet the exigencies of the working conditions. The cooling surface must be large to enable the engine to run continuously under heavy load in the heat of summer; and a fan, if fitted, must be easy of access and simple in its driving gear. The water supply carried must be sufficiently large to last for a long journey of perhaps a whole day away from the base station; for this reason a large tank for water, or equivalent radiator capacity, is provided in most models. Finally, it is necessary that the whole water system should be capable of being drained at its lowest points, to avoid risk of damage by frost when the machine is laid up in winter.

As the machines have to work in places distant from large manufacturing centers, it is moreover advisable that the design of radiator should admit of its easy removal from the vehicle, of ready access of its water joints, and of the possibility of executing repairs without special tools and appliances. The conditions of the problem are similar to those of the motor omnibus; more severe regarding the total cooling to be effected, and less severe in weight restrictions. The type generally adopted is the vertical gilled tube with top and bottom reservoirs; in some of the lower-powered tractors these reservoirs are made of sufficient size to avoid fitting a separate water tank. The water circulation is usually forced by means of a centrifugal pump or by a gear pump, the former type being the more common.

At normal revolutions per minute of the engine the lowest or first speed of the majority of chain-track tractors varies from 1.25 m.p.h. to 2.25 m.p.h.; on the second speed from 2 m.p.h. to 3.5 m.p.h.; and on the third or top speed, where such is fitted, from 3 m.p.h. to 5.5 m.p.h.

The changing of gear is usually effected by sliding gears or dog-clutches in a gearbox of motor-lorry type, the main clutch being disengaged for gear changing or reversing. Cut steel gears, case-hardened, are usual for spurs and bevels; plain bearings are commonly fitted in the gearboxes, which are of heavy design and usually of cast-iron.

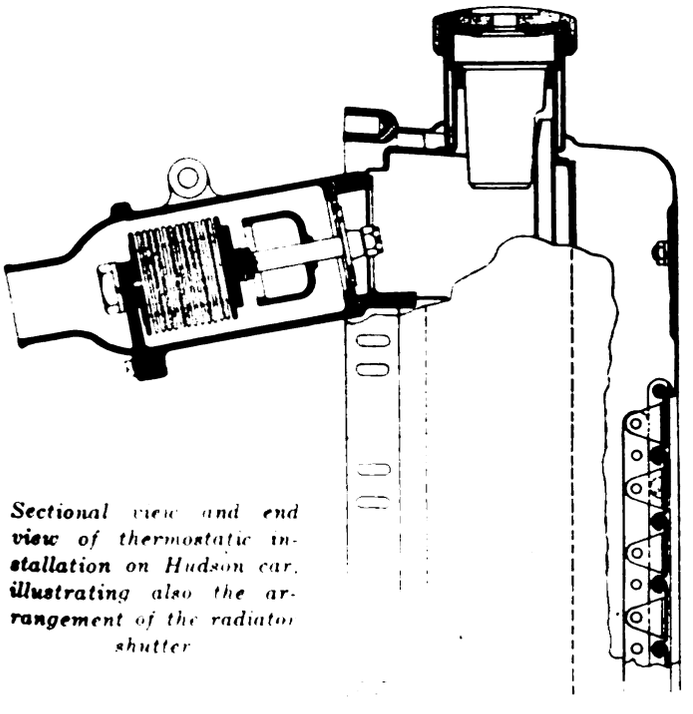
Thermostatic Control Considerations

Shortening of Warming-Up Period Reduces Crankcase Dilution—Installations Vary in Detail

By J. Edward Schipper

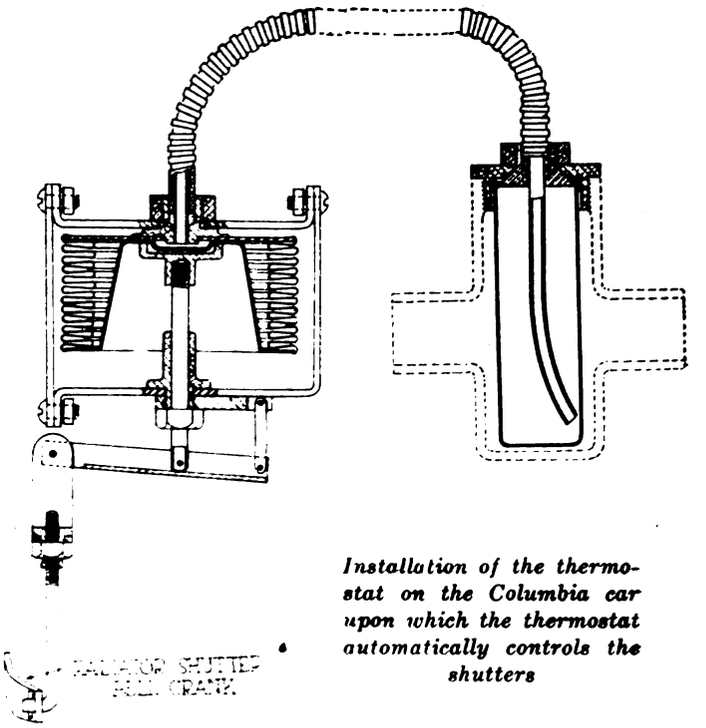
IN connection with the subject of crankcase oil dilution the question arises, to what extent this trouble may be obviated by the use of thermostatic water-temperature control. There is no doubt that the installation of a thermostat materially reduces the period required to warm up the engine, and, therefore, its use should have a beneficial effect in maintaining the lubricating quality of the oil in the crankcase.

Practical considerations enter into the question whether or not thermostatic control should be fitted. Probably the most important of these is the possibility of restrictions in the water passages, especially in systems not primarily designed for the thermostat. Undoubtedly, in extremely warm weather the effects of such restrictions would be noticeable, unless some sort of by-pass arrangement could be included so that the circulation would not be impeded.



The internal-combustion engine is essentially a heat engine, being used for converting heat energy into mechanical work. In proportion as the heat of the fuel is converted into useful work its efficiency is increased; conversely, the more the heat that passes into the jacket cooling water the lower the efficiency of the engine. In order to establish fairly constant working conditions a thermostat is so placed as to control the temperature of the water leaving the cylinders.

During the winter the advantage of such control is pronounced. When a car is left standing the temperature of the cooling water drops. Upon restarting the engine, if the whole volume of cooling water must be raised to the most efficient working temperature, considerable time must elapse, which results not only in delay and inconvenience to the driver but in the consumption of an extra amount of gasoline because of the necessity of employing the choke, and consequent increased leakage past the rings.



With the thermostat, only a small portion of the cooling water requires heating to the normal temperature. This results in a quicker getaway and a much smoother running engine. Aside from the resulting convenience to the driver, there is a saving in gasoline, because the thermal efficiency is much higher when the engine is working at its best running temperature.

Loss of Alcohol a Factor

Another factor to be considered in this connection is economy of anti-freezing solution. It has generally been found that alcohol solutions make the most satisfactory non-freezing fluid, and these solutions are very extensively used. With the thermostat set at a sufficiently high temperature to justify its use, there is naturally a tendency for the alcohol to be boiled off rapidly. If some provision is not made to take care of this, the maintenance of the solution at its proper strength may become quite a source of expense to the car user. This objection has been overcome by the Cadillac company by

the employment of a condensing apparatus which traps the vapor arising from the alcohol in a small tank beneath the car, from which it can be drained off at intervals and used over again.

If water-temperature control is to be developed further we will probably eventually come to the use of variable cooling surface, that is, variable radiator area. It has often been contended in these columns that it is a reflection on the engineering ability of the industry to see expensive passenger cars on which hundreds of dollars have been spent to secure pleasing appearance carrying a piece of old cardboard or newspaper over the front of the radiator in cold weather.

The use of radiator shutters has been one of the means used to control water temperature. Two well-known cars using the shutters are the Hudson and Columbia. On the Hudson the shutters have nothing to do with the thermostat. On the Columbia the opening of the radiator shutters is controlled by the thermostat. On the Hudson car, the radiator shutter, construction of which is shown in sectional view on page 638, when the thermostatic valve is closed the water is by-passed through the tubing to the intake side of the water pump. When the water has reached the running temperature the taper-seated valve is wide open and the flap valve opening into the by-pass is closed, so that all the water is forced through the radiator. This part of the system is automatic. The remaining part of the system is manually controlled by the driver, who can vary the effective radiator area by means of a lever under the cowl.

The advantage of the independently controlled shutters is that it eliminates the danger of the engine freezing while running. Even after the engine is thoroughly warmed up the water will freeze in the radiator when running into a severe head wind if the full area is exposed. By means of the shutters, with a motometer on the radiator cap, the driver can hold the temperature of the water at the desired point, while the thermostat takes care of the preliminary heating during the warming-up stage.

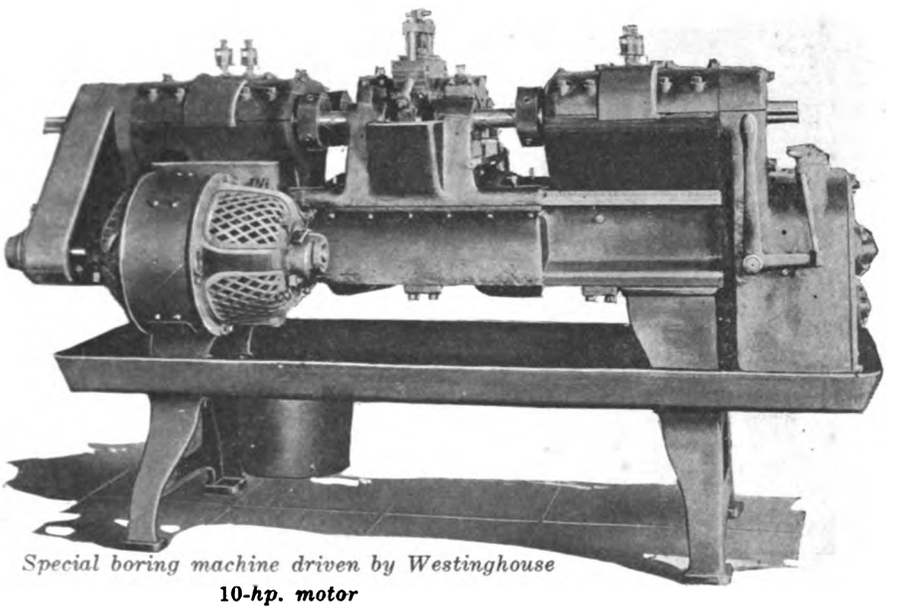
One objection to thermostat installations having only one valve controlling the flow of the water at the entrance to the upper tank of the radiator is that when the proper temperature has been reached, and the valve opens, the water can either flow into the upper tank of the radiator or into the by-pass tube. It will naturally divide between the two paths in the reverse proportion of their resistances. Such control is not desirable in that the full value is not secured from the radiating surface.

A 30 per cent saving in fuel through the use of the thermostatically-controlled shutters has been claimed by the makers of the Columbia car. A saving of lubricating oil, due to the reduction in crankcase dilution, is also claimed.

Make-Up of Thermostatic Control

Thermostatic circulation-control devices generally consist of two main parts. The first of these is a bulb and flexible tube containing the sensitive liquid, the latter being composed chiefly of ether. This bulb is held in an iron housing placed in the water-return line. The second part is an expansion drum of flexible copper, which is forced open in the manner of an accordion by the action of vapor given off by the contained liquid under the effect of heat. As the motor temperature varies, this drum opens and closes, and operates the shutter through a system of levers.

The thermostat becomes active as the temperature approaches 140 deg. Fahr., and the shutter, which, when closed, permits little water to pass through the radiator, begins to open. This opening action is continued until an engine temperature of 180 deg. is reached, at which temperature the shutter is entirely open. At 180 deg. the motor is working at its maximum efficiency. The highest possible temperature is essential to satisfactory performance with present-day gasoline of low volatility. With thermostatic control the maintenance of the highest possible temperature is rendered possible without danger of overheating the engine, as any variation of temperature affects the thermostat, and the valve is automatically shifted to meet the new condition. A motometer is generally used to show the driver that the temperature of the engine is being properly regulated, and is an essential part of thermostatic equipment.



Special Boring, Reaming and Facing Machine

A SPECIAL boring, reaming and facing machine built by the Reed-Prentice Co., Worcester, Mass., to bore, ream and face a steel forging used as an engine support in an automobile is illustrated herewith.

The work is held in quick acting clamps mounted on the revolving triangular turret of the carriage. All of the operations are automatic, with the exception of placing the work in the machine and indexing the turret. Each time the work holder is revolved 120 deg., the finished piece at the top is removed and another rough forging is placed in position with little loss of time.

There are four spindles, two on each of the opposing heads.

Two pieces of work are operated on simultaneously. The cycle of operations is as follows: The carriage moves toward the right; during its travel one piece is drilled and a second piece faced on one side. The carriage then automatically moves toward the left, during which travel one piece is reamed and the second piece faced on its other side, after which the carriage returns automatically to its neutral or starting position, at which point the feed is tripped.

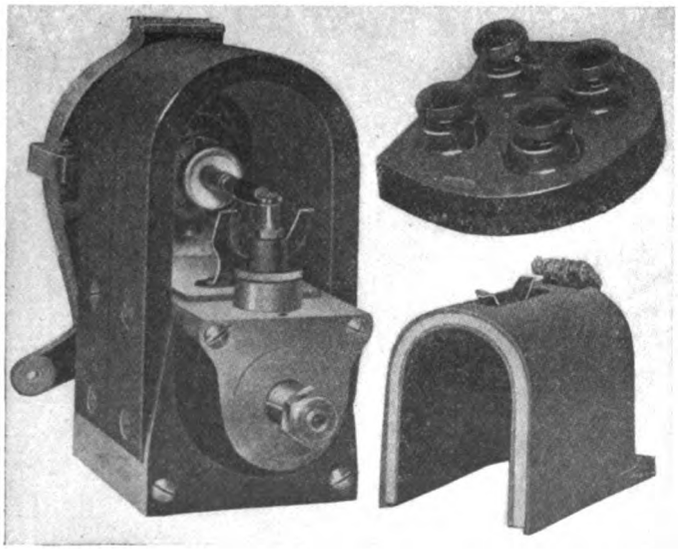
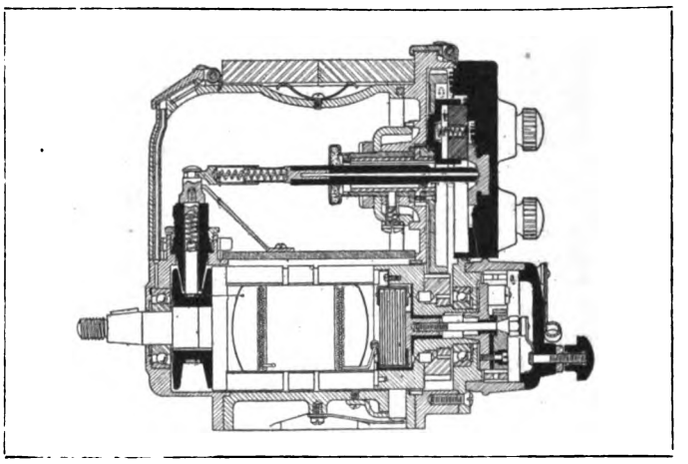
Lauraine High Tension Magneto



Made in All Standard Types for Terrestrial, Marine and Aerial Use

A NEW high tension magneto has been placed on the market by the Menominee Electric Products, Inc., New York. The machine is of conventional design throughout and is entirely water-proof. It is made in all standard sizes, and in addition to models for motor car, marine, truck and tractor work, a special light model made in aluminum for aircraft work has been brought out. By the use of aluminum and other light material a saving in weight of 4 lb. has been effected.



From the sectional view herewith most of the important constructional details may be seen. The armature is of the Siemens shuttle type and carries both the primary and secondary windings. One end of the primary winding is grounded on the armature core, while the other is carried out to the circuit breaker on the end of the armature shaft. The breaker arm bearing is built up of cross sectional fibre working on a pin which is integral with the main breaker block, thus preventing undue compression and expansion due to moisture or high temperature. The breaker cam is cut from steel tubing which is shaped, hardened and ground to size, and it is claimed that as a result of this construction absolute synchronism is assured. The breaker housing on these magnetos comes with two arms, so the machine may be installed on either side of the engine.

The high tension current is collected from the armature through a collecting ring and brush at the driving end. From this brush the current is transmitted to the distributer. The usual safety spark gap is provided to afford an outlet for the spark in case a high tension cable should come loose from the spark plug or the high tension circuit be interrupted in some other way. The spark at the safety gap may be observed through a small window in the water proofing cover. All parts of insulating material subjected to high tension are made of hard rubber. The distributer gear is adjustable for wear by means of an eccentric bushing, and it is claimed that this will insure quiet operation throughout the life of the machine.

In the Lauraine magneto the water proofing effect is carried out in a somewhat different manner from that found on most other magnetos. The water-proofing cover is inside

Lauraine magneto complete, its distributer block and water-proof housing

Section through magneto

of the horseshoe magnets, hence the magnets and also the end plate can be removed without disturbing the water-proofing effect. Although the water-proofing cover is inside the magnets, it also can be easily removed, in case it is desired to gain access to parts within it.

All castings, bases and end plates are made of bronze, which obviates trouble due to warping and consequent disalignment of the parts. The shaft height, shaft end and other features conform to S. A. E. standards. As will be seen from the sectional view, the armature is supported in annular ball bearings, while the distributer is carried in a plain bearing of very liberal size, which is provided with wick oiling.

—

Military Aircraft Problems

IN a paper published in a recent issue of the Journal of the Franklin Institute, W. F. Durand discussed some of the problems encountered in the development of fighting aircraft. Referring to the plan of firing safely through a revolving propeller by mechanism by which the gun is prevented from firing unless the propeller blades are clear, he said that this device was not always effective owing to occasional delayed ignitions. Hence blades were sometimes hit, but in general no great damage resulted. In exceptional cases, however, the injury to the propeller was serious, and might lead to disaster. Another method of firing dead ahead on "tractive" machines was to mount the gun on the upper plane so that it fired over the propeller, but the gun was not then under such ready control.

A third plan was to make the propeller shaft hollow and fire through it. This was only practicable when the propeller was gear driven, but this was now becoming desirable for other reasons since modern engines were being run at rates of revolution incompatible with the high efficiency of a direct driven propeller capable of absorbing the power developed. To get a good propeller efficiency it was, in short, desirable to keep down the speed, while to get a high development of power per pound weight of the engine it was necessary to put up the speed of rotation. With the V type of engine the shaft of a geared propeller might be, he said, conveniently arranged between the two rows of cylinders. In this way any desired gear ratio could be adopted, and by making the shaft hollow a path for the bullets was provided free from any possible obstructions.

Dimensions of Steel Tube Struts*

With Formulas and Graphs for Use in Selecting the Proper Size of Tube for Different Lengths of Strut and Loads

By Carlo Maurilio Lerici

THE accompanying graphs have been prepared in order to facilitate the calculation of the dimensions of such circular and streamline steel tubes as are employed in airplane construction. The diagrams give directly the compression permissible for a maximum load of 10 kg. per sq. mm. (13,750 lbs.-sq. in.); that is to say, with a factor of safety of six for steel commonly employed having an ultimate strength of 60 kg. per sq. mm. (82,500 lbs.-sq. in.). The streamline section tube is that of minimum resistance (Fig. 1), tested by Eiffel and adopted as standard by nearly all the constructors of the world. The fineness ratio of this section is about 3. The ratio of the two moments of inertia I_{zz} and I_{yy} is about 5. It will be easily seen that there is an almost constant relation between strength in compression of circular and streamline steel tubes.

For the standard type (Fig. 1) I have found that the streamline tube whose section has the external dimensions $d \times 3d$ has the same compressive strength as a circular section tube of the same length and thickness (gage), having an external diameter = 1.5 d. This factor has formed the basis for the graph Fig. 2. The following data are given: W = normal compressive load, L = length of tube. The graph shows that for each value of W there are generally several solutions according to the different values of the thickness adopted. In this connection it should be noticed that, in order to attain maximum lightness, one should adopt the minimum possible thickness s. The ratio of s to d should not be less than 1/30.

It should also be pointed out that the condition of minimum weight for streamline tubes exposed to a current of air, as the struts of an airplane, is only convenient in machines having a low flight speed. Generally it is possible to so dimension these tubes as to render minimum the power absorbed by their weight and by their head resistance. In the best of modern high-speed machines the total power P absorbed by one meter of streamline tube exposed to the air is given by the formula:

$$P = \frac{dv^3}{10^6} + \frac{34vds}{10^4}$$

d in cm.
s in cm.
v in metres per second.

$$P = \frac{7.25dv^3}{10^8} + \frac{7.85vds}{10^6}$$

d in inches.
s in inches.
v in. ft.-in.

An examination of this formula gives the following results: (1) For machines having a speed of not more than 120 km.

*From *Flight*.

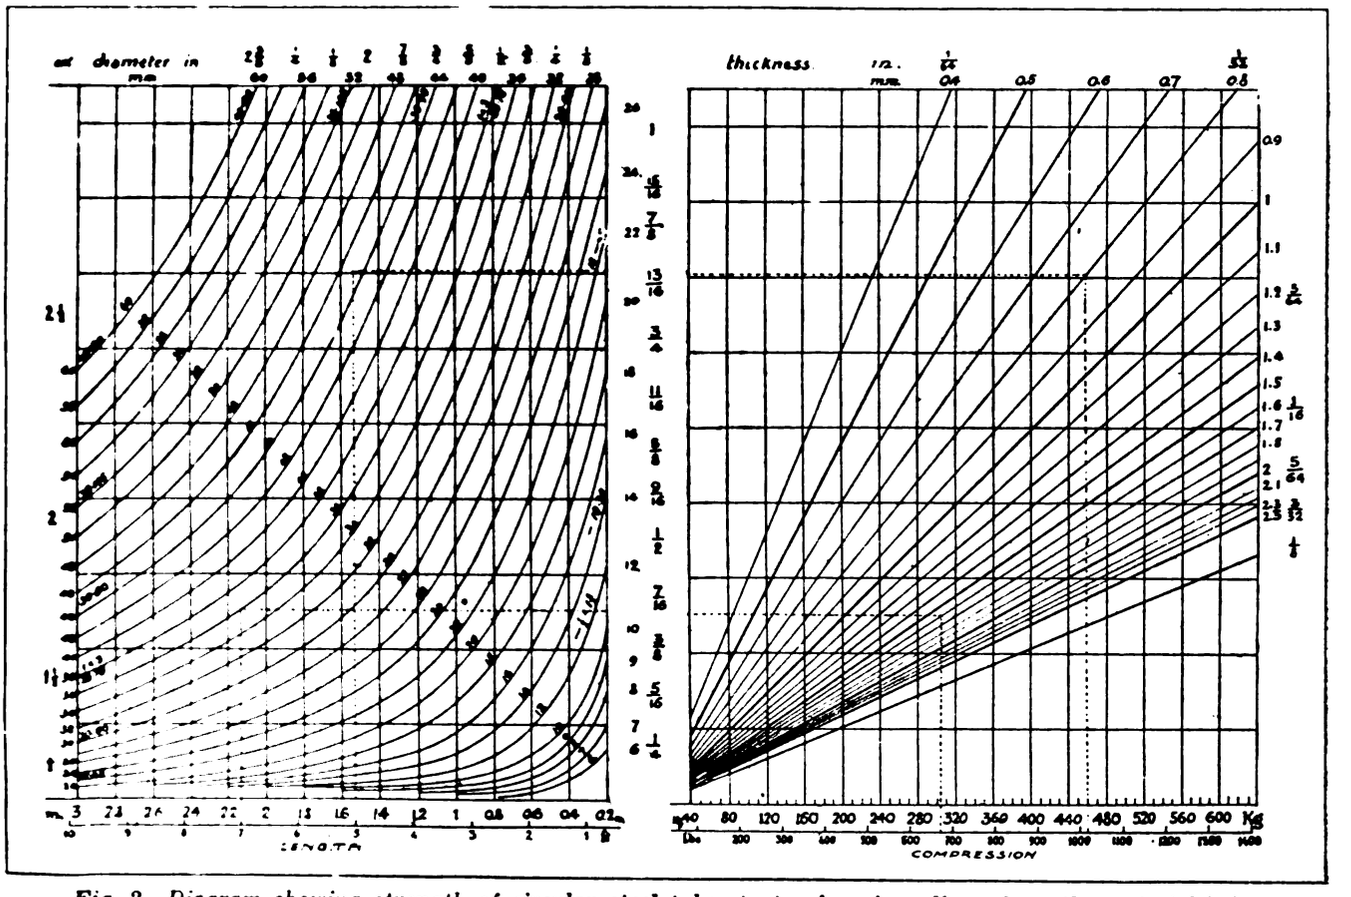

Fig. 2—Diagram showing strength of circular steel tube struts of various dimensions, the material being assumed to be steel of 74,000 lb. per square inch tensile strength. For the section shown in Fig. 1 the values found for circular struts must be divided by 1.5.

Digitized by Google

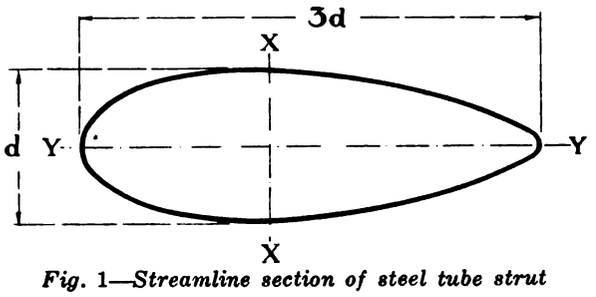

Fig. 1—Streamline section of steel tube strut

per hour (75 m.p.h.) the minimum value of P is obtained by giving the struts a thickness of between 0.8 and 1.6 mm. (1/32 in. and 1/16 in. respectively). (2) For machines of which the normal speed varies between 120 and 160 km. per hour (75 and 100 m.p.h.) the optimum thickness varies between 1.2 and 2 mm. (3/64 in. and 5/64 in.). (3) For speeds between 160 and 200 km. per hour (100 to 125 m.p.h.) the optimum thickness varies from 1.6 to 2.4 mm. (1/16 in. to 3/32 in.). (4) For speeds above 200 km. per hour (125 m.p.h.) the struts should be given the maximum possible thickness, weight having no longer any appreciable influence.

It sometimes happens that one has to depart from these dimensions giving maximum efficiency in order to avoid during flight every vibration that might diminish the compressive strength of struts. For instance, this happens when the frequency of the struts' proper vibration under normal load coincides with or is a multiple of the number of revolutions of the motor. Such a phenomenon of resonance can be countered by modifying one of the dimensions s or d.

The following examples show the method of using the graph:

(1) *Center Section Strut.*—Streamline section. Steel of 60 kg. per sq. mm. (82,500 lbs. per sq. in.). Factor of safety = 6. Length, 7 ft. Compression in strut, 670 lbs. Thickness s = 1/16 *in.* From the diagram it will be seen that the circular tube has an external diameter of 36 mm. (1 7/16 in.). Streamline tube having same length, $d = 36:1.5 = 24$ mm. (61/64 in.). As the fineness ratio of the strut is three, the dimensions should be about 1 ft. 3 in.

(2) *Chassis Strut.*—Streamline section. Steel, 60 kg. per sq. mm. (37 tons per sq. in.). Factor of safety, 6. Length 5 ft. Compression under normal load, 1020 lbs. Thickness 1/32 in. The circular tube indicated in the diagram as being of the requisite strength for this load has an external diameter of 45 mm. (1 13/16 in.). Streamline tube having same strength $d = 45:1.5 = 30$ mm. (1 13/64 in.). As the ratio of s to d is less than 1/30, it will be advisable to adopt a thickness of 3/64 in. In that case $d = 41:1.5 = 27.5$ mm. (1 3/32 in.).

Helping the Jobber Through the Dealer

By Allen Sinsheimer

THE Marvel Accessories Mfg. Co., Cleveland, Ohio, sells its products to the jobber. The jobber distributes them to the retailers. The dealers retail them to the public. At first glance the business of the Marvel company comprises chiefly the problems of manufacture and the organization of jobber distributors. But the company operates more intensively. It builds on the principle that its products are not sold until they are in the hands of the consumer, and it extends its sales activities beyond the jobber to the dealer.

The entire country is divided into territorial districts, each under the control of a responsible salesman, who sells to the jobbers in his district, and in addition, following the company's plan, also supervises the dealers in his territory. Each new dealer is watched. Aid and advice are given. And every jobber is urged to follow the same principle and to maintain sufficient stock to meet the dealer requirements.

Advertisements are placed broadcast by the company, reaching to every field, and creating a constant interest in the products. All inquiries resulting from the advertising, and sent to the maker, are in turn handed to the jobber or dealer, as the case may be.

Recently the company started its largest campaign based on:

Advertising in many publications.
Window signs for the dealer.
Lantern slides for the dealer.
Folders for the dealer.
Outdoor "gas" signs for the dealer.
Counter display signs for the dealer.
Circulars for the dealer's use.
Newspaper electros for dealer's use.
Demonstration patches.
And wall hangers, catalogs, etc.

Postal cards were forwarded with an announcement of the campaign to dealers, who were requested to check the advertising needs desired and to return the cards to the company's offices.

Each folder, window hanger, etc., was given particular attention, and was designed to carry a certain message. The campaign started at the height of the tire vulcanizing season. September is the month when motorists attempt to make used tires do for a period and carry them to the repair shops, and the company issued several pamphlets calling attention to its vulcanizing kits, which allow the motorists to vulcanize their own tires, besides a large window sign and a metal display card that can be attached to the gasoline pump, where every driver can see it.

A catalog of newspaper electros was sent broadcast, and resulted in hundreds of orders for electros from dealers who will co-operate in the campaign.

In the same way, pamphlets, folders, leaflets and window signs, designed to sell valve grinders, socket wrenches, chain fasteners and other products, were mailed to all dealers. The plan has been found extremely effectual, working prosperously for the company, jobbers and dealers, and welding all three into a close, harmonious manufacturing and distributing organization, where each division aids the other to a very important degree.

—

Discussing Metric System

THE British Institution of Electrical Engineers recently discussed the probable effect on the British electrical trade of the introduction of the metric system, especially in those markets in which the English system is now in vogue, with a view to determining whether the compulsory introduction of metric measures should be pressed or resisted.

—

IT is very important that in designing a charging equipment for electric motor vehicles provision should be made for boosting charges at high rates. The need of boosting may not at the outset be apparent. With roads in average condition, the possible mileage capacity of each vehicle may be ample for the daily service requirements. But inevitably there comes a time when the condition of the roads, combined possibly with high wind, is such that the energy taken per vehicle mile rises by from 50 to 100 per cent above normal. It is under such conditions that provision for boosting saves the situation and permits of the usual delivery service.

Testing Electric Ignition Apparatus*

Notes on the Measurement of Current in Electric Ignition Spark Circuits

By J. D. Morgan

IN connection with the testing of electric ignition apparatus, namely, magnetos and induction coils, it is required to measure the current in the high tension spark circuit. Owing to the complex character of the current, the problem of measurement is a difficult one. At present the problem appears to be incapable of complete solution, and the task of producing a practical instrument resolves itself into devising means which will give useful indications when subjected to the actions of different currents having the same general characteristics.

The currents in the spark circuit of a magneto or induction coil are intermittent and oscillatory. In most cases the oscillations are superimposed on a unidirectional discharge. Also the oscillations are divisible into two successive parts, in the first of which the frequency is enormously higher than in the second. Plotting current against time, the general characteristics of a single discharge are related, as shown in Fig. 1. In some special cases the discharge is as shown in Fig. 2. Possibly the first part (a) consists of a series of oscillations, but the frequency is so great that the image of the spark in a rotating mirror is seen as a single bright line. The image of the second spark (b) is seen as a row of parallel lines which are much less bright than the first. It is to the current corresponding to the first bright line in the spark image that the difficulty of current measurement is due. This current is associated with the self-capacity of the spark generator. When the interrupter in the primary circuit is opened there is a rapid change of flux in the system. For a short interval at the commencement of this change a small quantity of current is stored due to the self-capacity of the generator. When the voltage reaches such a value that it breaks down the spark gap, the stored current discharges and produces the first part of the spark. It follows that this part of the spark has a practically constant value.

Tractors Affecting Spark Energy

In all ignition apparatus the current in the spark circuit depends on the speed of operation of the spark generator and the size of the spark gap. In magnetos provided with means for varying the position at which the contact breaker is opened in the revolution of the armature, current variations also accompany adjustment of the contact breaker. The character of the variations found in a normal magneto is as follows: Keeping the gap constant and fixing the contact breaker, the current increases with the speed. Keeping the speed constant without varying the contact breaker, the current increases with diminution of the spark gap. Keeping the gap and speed constant the current diminishes at low speeds when the contact breaker is moved from the "advanced" to the "retarded" position, and at high speed increases continuously or passes through a maximum

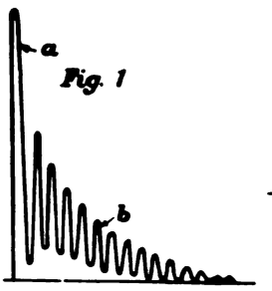

Fig. 1

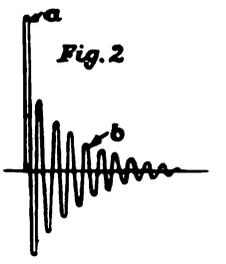

Fig. 2

value with the same adjustment of the contact breaker.

Obviously, any current-measuring instrument to be useful, must be capable of indicating the changes above mentioned, and to anyone unfamiliar with the problem it may appear remarkable that there should be any pitfall to avoid in constructing a suitable instrument. Some form of thermal ammeter or galvanometer is likely to give the best results, and several forms have been tried with ignition apparatus. In two, the heated element carrying the current to be measured consisted of extremely fine wire of comparatively low resistance. These instruments were of exquisite construction, but both showed a surprising behavior. With each a diminution of current was indicated with a diminution of spark gap instead of an expected increase. One indicated a constant current instead of a current which increased to a maximum and then decreased when at a certain speed of the magneto the contact breaker cam was moved from the advanced to the retarded position. Both gave at all

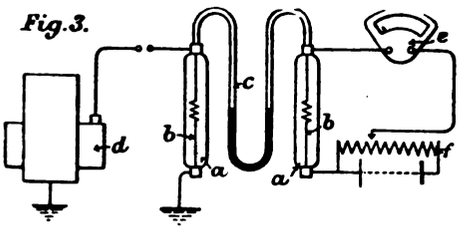

Fig. 3.

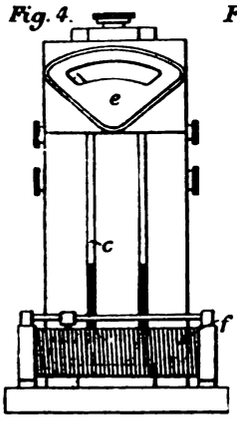

Fig. 4.

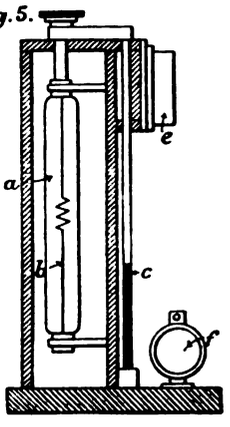

Fig. 5.

*From Engineering, London.

Digitized by Google

speeds current values which were known to be much too high. One of these instruments was made to behave in a proper manner by E. A. Watson, by the inclusion in the instrument circuit of an inductance and a capacity which shunted the extra high frequency component of the current past the instrument and allowed only the component of lower frequency to pass through it.

Developing Measuring Instrument

Proceeding on different lines, the writer concurrently developed for his own work another type of instrument, the scheme of which is shown diagrammatically at Fig. 3 and the general appearance at Figs. 4 and 5. A pair of similar glass chambers *a* containing a metal or carbon filament *b* are connected to a capillary fluid indicator tube *c*. One of the filaments is connected to the spark circuit of the magneto *d*, as shown, while the other is connected to a battery circuit through a milliammeter *e* and variable resistance *f*. The heating of one of the chambers by the magneto current is balanced by the heating of the other by the battery current. With the particular filaments used, it is found near enough for practical purposes to take the milliammeter readings as the equivalent of the magneto current when the balance is obtained. Comparison with the instrument corrected by Mr. Watson shows that the indications of the two instruments agree very closely.

An essential condition of success in the instrument shown in Fig. 3 is that the filaments shall be of relatively high resistance. In the first model 16 cp. carbon filament lamps were used, these having a resistance of 1500 ohms each. Later cylindrical lamps recognizable in the drawings, and provided with comparatively thick metal filaments of 500 ohms resistance, were used, and found quite satisfactory. These instruments are sufficiently sensitive, and show the current variations which are expected from the theory of the ignition apparatus under test.

Ammeters for Complex Currents

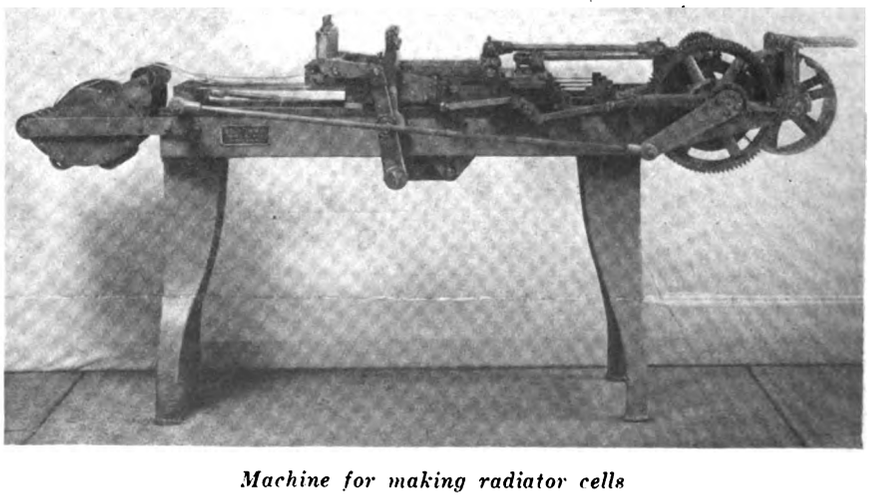
In designing thermal ammeters for complex currents having widely different oscillatory components, it is necessary to pay careful attention to the heated element. If the element is made of low resistance, the instrument readings will be determined mainly, if not solely, by the high-frequency component of the current, whilst if wire of high resistance is used the readings will be determined mainly, if not solely, by the low-frequency component. Taking a typical experiment, one of the instruments first mentioned in this article was connected to a magneto, and its indication was found to be not only excessively high, but also constant for all positions of the contact breaker cam when the speed was kept constant. The only component of the current which could remain constant under this condition was the extra-high frequency component and the current value attained in it is undoubtedly much higher than in the other. Using the writer's instrument, the current value was much lower, and, repeating the test the expected variations were indicated.

It follows from the foregoing that different types of thermal instruments and varieties of the same type can give very different accounts of the same piece of ignition apparatus. Further, it follows, that in setting up a standard instrument it is necessary to settle beforehand which of the two current components shall be taken as the main or sole basis of comparison. A variety of considerations which are irrelevant to this article, and which are based on the properties of ignition apparatus, as well as on certain phenomena, lead the writer to the conclusion that it is the current of lower frequency which is the more useful for comparative measurements.

—

Brake Lining with Jute Backing

OUR attention has been called to a new method of making brake linings and clutch facings which consists, briefly stated, in weaving a fabric with an asbestos facing and a jute or cotton backing, the asbestos preferably having the usual wire reinforcement. This fabric is then given substantially the usual brake lining or clutch facing treatment. The advantage claimed for this new material is that the jute, cotton or other material used for a backing is somewhat more resilient than the asbestos and thus enables the brake or clutch in which it is used to take hold more gradually. In the case of a three or four-ply fabric, it is proposed to make one or more of the middle plies of jute or cotton and use asbestos for the outside plies. The manufacturers anticipate a great future for this material.



—

Automatic Machine for Making Radiator Cells

THE accompanying photograph illustrates a special machine built for the F.I.A.T. Co of Turin, Italy, by the Stolp Co., Inc., Geneva, N. Y. The Fiat Co. has large orders for cars and trucks from the Italian Government and also makes the power plants for the Caproni biplanes. Its output is such that 2000 radiator cores are required per month, and this requires forty operators to produce the cells, using ordinary dies and tools, by which the cells are made in four operations.

With the machine just developed by the Stolp Co. three operators, one on each machine, will do the work, resulting in an enormous saving in wages. In addition to the saving in wages there is a saving in material. Formerly the Fiat company made its radiator cells from brass ribbons 55 mm. wide, but the machines make the same tubes from stock only 50 mm. wide, producing a perfect lock seam.

It is generally admitted that the cellular types of radiator are the most efficient, on the basis of the amount of metal used. That it is not more extensively used has generally been attributed to the large amount of labor required in its construction. It is possible that the introduction of this new machine will have a tendency to popularize the cellular radiator again.

British Gasoline Cable Tractor

Advantages of Cable Plowing—Description of a British Gas Tractor Designed for Hauling Plows Through the Intermediary of a Cable

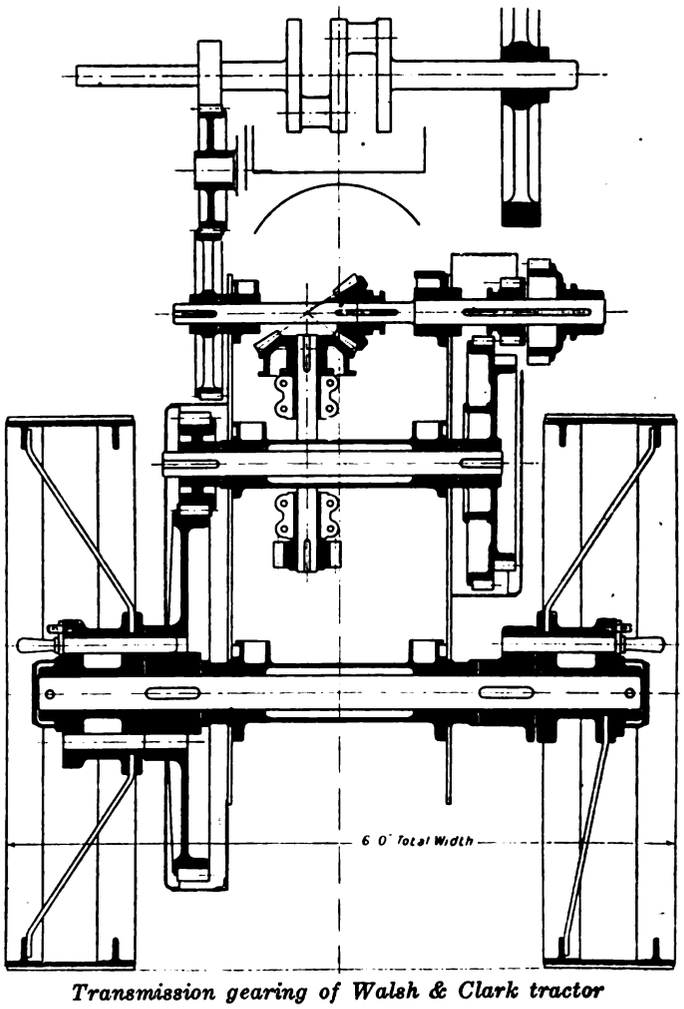
IN Great Britain the cable plow has had quite a vogue for a good many years, but almost exclusively in connection with steam power. Tillage by this system has several advantages over that done by horses, or even by the direct traction method now so much in use. It enables a much greater depth to be cut, and thus gives protection against both excess of rainfall and drought, while a more thorough mixing and disintegration of the manure with the soil is brought about. Another possible advantage is that plowing by this method can be carried on when the land would not be in condition to carry a tractor, provided the engines can be taken to the headlands. But a set of steam plowing tackle involves the expenditure of a considerable amount of capital. With the object of providing an equipment less costly than the usual steam plant, the firm of Walsh & Clark, Limited, of Guiseley, near Leeds, England, has designed a plowing set which operates on the cable system, but in which the motive power is supplied by internal combustion engines which are started on gasoline but run mainly on kerosene. Several views of the machine are shown herewith, the drawings being reproduced from *The Engineer*. Each engine weighs close upon 6 tons, and is rated at from 30 to 35 brake horsepower at an engine speed of 600 r.p.m. when traveling or plowing, and 22 brake horsepower on the driving belt.

As will be seen, the engine is of the horizontal pattern. It is secured to the barrel frame, and has two cylinders, 7 in. diameter by 8-in. stroke, with cranks set at 180 deg. On one end of the crank shaft of the engine is a simple clutch pulley, while on the other end is a flywheel. The clutch pulley has a long sleeve machine-cut steel pinion with twenty teeth, which meshes with a spur wheel with fifty teeth on a second motion shaft. This shaft serves to transmit motion either to the winding drum or to the road wheels. In the former case a sliding bevel pinion is brought into engagement with a bevel wheel keyed on a vertical shaft, on the lower end of which is a spur pinion which engages with teeth on the inside of the rope drum. The vertical shaft is carried in cast-iron bushes in brackets secured to the cross plate of the engine frame. The sliding bevel wheel is moved in and out of gear by means of a lever from the driver's seat. The movement of this lever also serves to operate a hand brake on the vertical shaft to prevent the drum running back and unwinding the rope.

On the right-hand end of the second motion shaft above mentioned are two floating steel pinions, either of which can be brought into engagement with a double spur wheel on the third motion shaft, on the other end of which a pinion is keyed. This pinion drives a large spur wheel which runs loose on the main axle, but can be secured to the road wheels by two pins. The road speeds thus provided are 2¼ and 4½

Internal combustion engine tractor used for cable plowing. Built by Walsh & Clark of Leeds, England

Digitized by Google



m.p.h. The driving wheels are 5 ft. diameter by 14 in. wide and are fitted with cross strakes, while the front wheels are 3 ft. 7½ in. by 8 in. wide. No differential gearing is provided. Reversing is effected by means of a wide pinion carried in a swinging link and engaging with the large double spur wheel on the third motion shaft, and the slow speed pinion on the second motion shaft. Locking gear is provided to prevent any two gears being in mesh simultaneously.

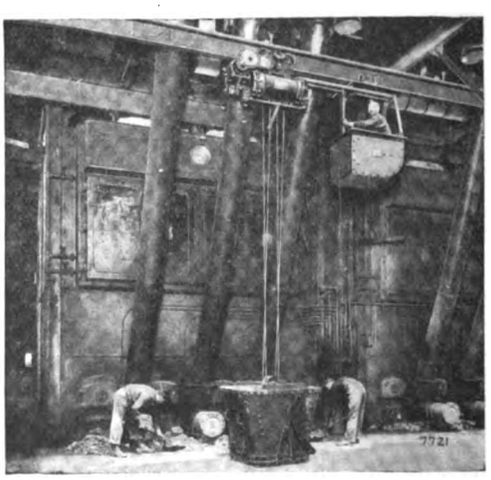
The barrel portion of the engine is used as a fuel oil tank, and besides giving the maximum stiffness to the whole machine, thus provides storage space for 50 gal. of fuel, which is enough for over four days' plowing operations. The barrel is 1 ft. 9 in. diameter and is made of ¼-in. steel boiler plates. The winding drum is carried by a stiff stud plate, ½-in. thick, double riveted to the shell and with a stiffening plate inside. The horn plates are of ⅜-in. boiler plating riveted to a cross plate at the rear end of the barrel. The third motion and main axle bearings are extended right across to each horn plate, and give further rigidity to the frame.

The valves of the engine are placed in the water-jacketed cylinder heads, and are operated by rocking levers and rods from two separate cam shafts in the engine crankcase. These cam shafts are driven by 2 to 1 spur gearing from the crankshaft, and a centrifugal governor mechanism is provided in the gearing to operate the throttle valve in each cylinder head. When starting from cold, gasoline is used, and is admitted to a small tank on each cylinder, from which it is drawn into the cylinders. Thé kerosene is also delivered by a pump into these fuel tanks, but on its way to the cylinder passes through a vaporizer formed by a nest of tubes in the exhaust passage. The engine is fitted with high-tension magneto ignition and impulse mechanism for giving a hot spark at starting.

The engine is designed to exert a continuous pull on the rope of 3500 lb. It is intended to haul a four-furrow plow on medium and light land, and a three-furrow plow on heavy land. A pair of engines can, we understand, plow from 7 to 10 acres per day of 10 hr., according to the nature of the land, and with rope speeds of from 250 ft. to 350 ft. per min. They will also cultivate from 14 to 20 acres per day. The winding drum carries 450 yd. of steel rope, which is coiled automatically by means of special coiling mechanism. The clutch pulley is 1 ft. 9 in. diameter by 6 in. face, and the flywheel 2 ft. 9 in. diameter by 4 in. face, and the engines are fitted with brakes to act on the drum on the large double gear on the third motion shaft. The steering is by hand wheel, worm and chain.

The special features of the radiator are the method of mounting it on the front end of the cylindrical frame and the means provided for inducing a current of air around and through the flanged tubes. The method of supporting the radiator is shown in the illustration, and requires no further description. The draft is caused by passing the exhaust gases round a large conical nozzle in the base of the chimney.

Transmission gearing of Walsh & Clark tractor



Summed up in a few words, the Walsh & Clark engine is a miniature replica of the large steam plowing engine as regards the cable mechanism, with the power supplied by a kerosene engine. The machine can also be employed as a tractor, whether for road or field work. On level roads it can haul a weight of 8 tons gross at 5 miles per hour. On the land it can haul plows taking a four-furrow plow over light land cultivators, harrows, etc.

Improved Ash Handling Apparatus

A MONORAIL electric hoist, with a bottom dumping bucket, lends itself readily to installation in existing boiler houses for ash handling purposes. This is especially true where the ashes are pulled out on the boiler room floor, which is often the case. The accompanying view illustrates an installation of the Link-Belt monorail hoist in the boiler house of a paper company.

This machine runs on the lower flange of an I-beam track. It is operated by a man traveling in a trailer cage, who controls the raising or lowering of the bucket, as well as the travel of the hoist. The laborers who clean the fires fill the bucket with ashes; the operator then hoists his bucket and runs it out directly over the car, where he dumps it, by the motion of a lever in the cage. The current required is said to be very small.

In this instance, the superintendent designed his own track support, the Link-Belt Co. of Nicetown, Philadelphia, Pa., furnishing the track and conductor. While he did the work quite cheaply, he also made a good job of it. About 30 tons of ashes are handled. They are pulled out every six hours. Two men do the work of shoveling into the buckets, and then one of them gets into the cage and runs it out into the car. At other times, to hurry the work, an additional man operates the hoist, remaining in the cage. The bucket holds 1¼ cu. yd. and is handled by a 2-ton hoist.

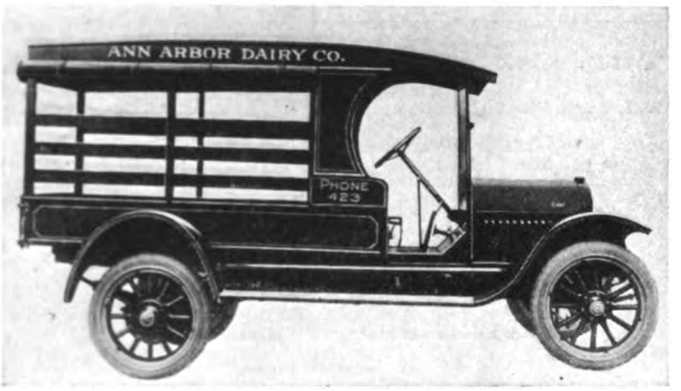
Collier Assembling 1500-Lb. Wagon

Furnishes Choice of Three Bodies and Electric Lighting and Starting for $885 f.o.b. Factory



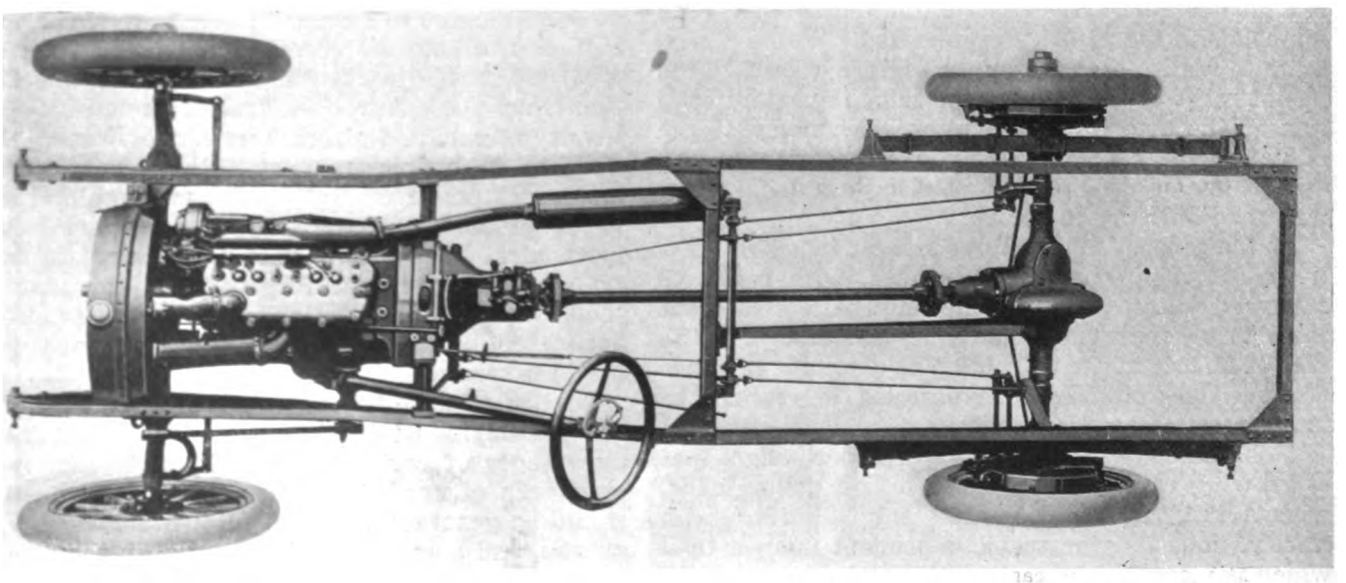
THE Collier Motor Truck Co., Bellevue, Ohio, is marketing a ¾-ton truck, selling for $885, with a choice of three body types. The truck is mounted on a 118-in. wheelbase chassis and has a 7-ft. loading space. The price includes the body, lighting and starting system. The truck is adapted to a wide range of usage where ability to carry heavy loads is not required but rather ability to make frequent and quick trips. In order to make relatively high speed practicable the truck is equipped with pneumatic tires.

The chassis is an assembled unit having a Lycoming engine, Mechanics Machine Co. clutch and gearset, Salisbury axle, Goodrich tires and Salisbury wheels. The car is shaft driven. The Lycoming engine is a four-cylinder type with two crankshaft bearings. Its bore and stroke are 3¼ by 5 in., the cylinders being cast in one block, with the valves on the right side. Cooling is by thermo-syphon circulation in connection with a cellular radiator having a pressed steel radiator case. Ignition is by a single system (Connecticut) with current from a Willard 6-volt, 80 amp.-hr. battery. A two-unit starting and lighting system (Auto-Lite) is provided as stock equipment. The carbureter is a Zenith, and fuel is fed to it by gravity.

The transmission system comprises a Raybestos faced, dry disk clutch. The selective three-speed gearset is mounted in a unit with the engine. The gears and rear axle provide a reduction of 6, 10½, and 18 to 1 forward, and 24 to 1 reverse. The drive is by means of a direct bevel gear through a three-quarter floating axle to the rear wheels. The propulsion is taken through a torque arm, which also absorbs the braking and starting torque. The springs are semi-elliptic all around. The wheels carry 32 x 4 in. tires.

The construction of the chassis is along conservative lines, a straight after section being used beneath the pay load and a slight bottle-neck effect forward of the center. This narrows at the front end of the frame to permit of shorter turning radius and also makes for a shorter supporting arm for the power-plant and radiator. The torque arm is bolted to the differential housing and to the central cross member. There are two universals in the drive, as will be noted from the plan view of the chassis herewith. The chassis frame is of pressed steel, 4 in. deep. The steering gear is a worm and gear type with an 18-in. hand wheel and with springs in the connecting link to the front axle for absorbing shocks.

The bodies offered are of the open express, side panel delivery and semi-closed type with side curtains.



One body type offered with the Collier truck

Flexible Coal Gas Containers

FROM information gathered by the Gas Trade Committee, it appears that so far about 4500 commercial vehicles have been adapted to the use of coal gas as fuel in England. Orders have been placed for 2500 additional flexible gas containers, all for commercial vehicles, and these are to be completed during the next few months. So far less than 4 per cent of the orders received by the manufacturers of these flexible containers have been for private vehicles, and no further such orders will be accepted. Practically all of the work on these containers is done by female labor. It is estimated that as a result of the use of coal gas for operating motor vehicles a saving of 3,000,000 gallons of gasoline a year is effected.

Shall Our Road System Break Down?

HOW shortsighted we can be at times is well illustrated by the discrimination against road materials in the priority regulations. We have now come to realize that the public highways bear to the business life of the country the same important relation as the arteries to the internal economy of the human body. Yet, in the Government's priority orders, one of the classes first discriminated against was road-building material.

At the present moment our richest industrial districts are in a veritable cul-de-sac, with railroads crammed to capacity and the only outlets in some cases in a condition which defies description. The case of Michigan can be held up as a specific instance of how the authorities have failed to realize the importance of good highways.

This commonwealth, with a war order budget that is growing rapidly toward the billion dollar mark, with a railroad situation that only a miracle can clarify, finds its war traffic dependent upon a trail which is more like a bottomless pit than a road and which *in some parts is only 9 ft. wide!*

Between thirty and fifty military trucks, loaded with war material, plow their way daily over this Michigan road. In their wake are hundreds of commercial and passenger cars bound for Eastern points. Millions of dollars' worth of commerce taking this route is held up on a 9-ft. road and no permanent relief is expected by local road authorities before Aug. 1. At this time a year ago, August, 1917, was the date set for the completion of the permanent road.

This is only an example of what holds true in many other localities. Why should not the Government put a thousand men to work on a road of this kind? In a foreign military country it would have been done long since, as it would have been realized how serious a matter it is to have traffic of this importance in constant jeopardy. It is too long to wait until Aug. 1, particularly when past experience shows that little credence can be placed in a prediction of this nature.

One of the reasons given for the non-completion of many of the roads last fall was the embargo on road materials. This should never come up again. The Government would not think of holding up materials to repair and maintain the railroads of the country. The tonnage carried over the highways this year will far exceed the tonnage of any previous years and will probably overshadow that moved on the railroads. By all means let us watch the more essential highway arteries more closely than ever. Let us maintain them and keep them clear of mud in summer and snow in winter. Their importance cannot be over-estimated.

A New Phase in Standardization

AN effort is now being made to get the authority of the Federal Government back of certain standards which it is proposed to formulate and which cover machine parts of very general use. Standardization in this country originated in the automobile industry, and the rapid growth and prosperity of this industry during the past seven or eight years are by many believed to have been due in no small degree to this practice. It was, therefore, but natural that standardization should spread to other industries, and it was a first step in this direction when the motor boat, tractor, motorcycle, stationary engine and aircraft industries joined hands with the automobile industry in the Society of Automotive Engineers. But even the combined automotive industries constitute only a part of our mechanical industries, and if it is desired to standardize screw threads, for instance, the standard should be sponsored by an organization whose influence is coextensive with the industries using machine screws.

No doubt in the natural course of events all of the mechanical industries would eventually realize the advantages of certain standards, and possibly the standards of one of the most aggressive branches would be generally adopted. However, we are now at war, and quick action is essential in the removal of any barriers to rapid and efficient production. Screw threads have been standardized in the past,

Digitized by Google

and for a wide range of sizes there are now three different pitches, covering a very wide range of conditions of use. However, to make screws truly interchangeable it is not sufficient to specify the pitch and form of thread. It must be realized that whatever the dimensions specified, these cannot be obtained in commercial work with absolute accuracy. We had a good illustration of this when the S. A. E. spark plug thread was first adopted. The object of this plug standard was to make it possible to use any make of spark plug in any engine. It was soon found, however, that the plug threads often came slightly over-size and could not be screwed into the cylinders. There was something lacking in the plug specifications, as originally drawn, which has since been supplied, and that is tolerances.

The same thing applies to screw threads in general. It is commercially impossible to make a screw thread of any definite pitch diameter, etc. Certain limits must be set within which these dimensions may vary, and this is the tolerance. Without tolerances it is impossible to have screws made in one plant and nuts or machine parts with tapped holes of the same nominal size in another and have any screw fit any nut or hole.

It is a rather novel proposition that the appointment of a commission to adopt screw standards should be made the basis of action by Congress. It is not the power of Congress to enforce the commercial adoption of any standard which may be formulated, but rather the prestige which would be given the standard by the sanction of Congress that is motivating those who are championing the bill. If it were not for the relation of the matter to the war it would seem that the formulation and promulgation of such standards would come within the province of the Bureau of Standards. What makes direct action by Congress more desirable in this case is that the screw thread standard is needed particularly in the work of the War Department and of the Navy. Now, the Bureau of Standards is a part of the Department of Commerce and there seems to be an aversion on the part of the branches of our Government to make recommendations or take action that might be construed as interference with other departments. Action by Congress would remove any question of authority.

Airplane Wing Coverings

BEFORE the war practically all airplane wings, ailerons, rudders, etc., were covered with linen. What makes this material especially adapted to the purpose is that, besides having great strength in proportion to weight, due to the long fibers of flax, it can be rendered taut and very smooth by treatment with acetate or nitrate dope. However, it was not long after the great value of the airplane for scouting and bombing purposes was realized and large-scale aerial programs were laid down by the different nations that the supplies of flax, from which linen is made, ran short. By far the greatest flax-growing country previous to the war was Russia, whose acreage sown to that crop was more than 80 per cent of the world's total. Next came Austria, Italy and Roumania in the order named, followed by Germany and France. Realizing the great demand for linen that would arise the various governments at an early date imposed embargoes on flax and linen, but in spite of these embargoes and of every possible encouragement to flax growers the supply has not kept up with the demand and substitutes have had to be looked for.

Experiments have been made with both cotton and silk, and it is understood that the former has given the best results in every respect. This is most fortunate, as the supplies of cotton—even of the special grades of long staple used for the purpose—can be greatly multiplied and produced at much less cost than silk. One of the chief objections to silk, and which it shares with many other fabrics, is that it does not hold the dope, so the covering cannot be made as taut and smooth as a dope-treated linen covering, and hence does not permit of reducing the skin friction to the same low figure. We are informed that the problem of a satisfactory wing covering of cotton fabric has been fully solved and that large contracts for such material have been given by allied governments.

On the other hand, there has been some talk of the Germans using metallic wing coverings. While the proposition may have been given some thought, there has been no evidence in descriptions of captured enemy planes of its having passed into practice, and as all the leading flax-producing countries of the world are now either under enemy control or commercially accessible to the enemy it is hardly likely that he will waste much time finding linen substitutes.

Force Feed Oiling

IT has long been known that force feed oiling is especially desirable in engines operating at high speed and running most of the time close to full load. Everybody will admit that a bearing to which oil is supplied under pressure in a constant stream will withstand a higher pressure per square inch than a bearing dependent on splash oiling or gravity feed. Once in a while a record has been set up by an engine using the splash system of lubrication and this has tended to create the impression that if correctly designed the splash system is as efficacious as the force feed system.

It is all a matter of bearing surface. With each system there is a critical bearing load which must not be exceeded if risk of failure is to be avoided. If the bearings are made sufficiently large so that the critical pressure for splash lubrication can not be exceeded then splash lubrication will give satisfactory service.

However, in an aircraft engine where high weight efficiency is a prime essential, it is impossible to provide this liberal bearing surface, and the force feed system of lubrication is the only one justified. In fact, the pressure under which the oil is fed should be rather higher than has been customary in the past.

St. Louis To Use Return Loads

100-Mile Radius To Be Employed—Ohio Urges Its Use

WASHINGTON, March 27.—The return loads system of motor truck transportation is taking hold in many sections of the country. St. Louis, Mo., is organizing a truck organization to handle the return loads business for St. Louis and surrounding country within a radius of 100 miles under the direction of the St. Louis Chamber of Commerce. The State Council of Defense of Illinois has appointed an active committee to work with the chambers of commerce and commercial organizations throughout the state to establish return loads bureaus. Numerous inquiries are coming into the offices of the Highway Transport Committee asking for information about the establishment of return loads bureaus. Detroit, Chicago, Cincinnati, Cleveland, Youngstown, Pittsburgh, Buffalo and a number of other cities are already establishing some motor truck transportation, although very few as yet have created return loads bureaus.

The above information was brought back to Washington by Frank E. Williamson of the Highway Transport Committee, who addressed the National Industrial Traffic League in Chicago on March 20, where he explained the objects of the committee and its work establishing return loads bureaus in cooperation with chambers of commerce and other commercial organization in the territory north of the Ohio River and east of the Mississippi to the Atlantic seaboard. The National Industrial Traffic League is composed of the principal shippers and manufacturers of the United States and Mr. Williamson's address has resulted in numerous favorable inquiries from league members.

The Highway Transport Committee is publishing a pamphlet which will be ready for distribution early next week and which will explain in detail how return loads bureaus can be established and maintained. The pamphlets will be distributed to all chambers of commerce, public service commissions, state highway commissions and municipalities. Pamphlets can also be obtained by application to the Highway Transport Committee, Munsey Building, Washington, D. C.

The Highway Transport Committee has received word of organized effort by the Ohio branch Council of National Defense to supplement steam and electric railroad transportation by motor truck transport. A meeting was held at Columbus early this month and representatives of traffic bureaus of the chambers of commerce in the principal Ohio cities conferred with the transportation committee of the Defense Council. A resolution was drawn up stating the need for additional transportation facilities and it was recommended that return loads bureaus be established in all cities. A sub-committee of the Defense Council was named to work out the development of this plan. The development of systematic motor truck transportation through country districts for the collection of milk from farms to be delivered in cities will assist materially to solve the difficulties which confront the chief and efficient production and distribution of milk in Oho.

—

Continue Iron and Steel Prices

WASHINGTON, March 26.—The President to-day approved the recommendation of the Price Fixing Committee of the War Industries Board that the maximum prices heretofore fixed by the President upon the recommendation of the Board, upon ore, coke, steel and steel products, subject to revision on April 1, 1918, be continued in effect until July 1, 1918; from April 1 to July 1, however, the maximum price of basic pig iron be reduced from $33 to $32 per gross ton, and that the maximum price of scrap steel be reduced from $30 to $29 per gross ton.

No new contracts calling for delivery of any of these commodities or articles on or after July 1, 1918, are to specify a price unless coupled with a clause making the price subject to revision by any authorized United States Government agency, so that all deliveries after that date shall not exceed the maximum price then in force, although ordered or contracted for in the meantime.

—

Stock Market Reflects Curtailment

NEW YORK, March 27—There has been a direct reflection in the stock market of the action of the government in reducing automobile production by 30 per cent, a condition which is but natural. During the past two weeks 26 of the listed automobile stocks have shown declines of from ½ to 4 points. Among these that have dropped most have been Chevrolet, which went down 4 points, Fisher Body Corp., 4 points, Maxwell preferred 4 points, and Studebaker 3 points. To offset this there have been some gains, such for example as Hupp preferred and International common, 5 points, International preferred, 11 points, U. S. Rubber 8 points.

No Chrome Steel Shortage

California Has Large Supplies —80,000 Tons in Storage

WASHINGTON, March 27—There will be no shortage of chrome steel for some time to come if at any time. This announcement can be made following investigations by industries interested which reveal:

Eighty thousand tons of chrome has been stored away which has been owned by a huge metallurgical concern, hoping by its storage to increase prices.

Thousands of tons of chrome ore have been found in California mines.

After six months of deliberation and waste of time Washington officials have ordered electrodes supplied to the California mines, which means that the chrome ore mined in this country will be refined and supplied for use.

Some idea of the value of the 80,000 tons of chrome that has been hidden away may be had from the fact that in past years we have only imported 28,000 tons of chrome per year. In other words, a three-year supply of chrome was stored away.

Following this long delay, the War Industries Board has notified the Shipping Board that we can use the chrome on hand and that mined in California and that ships to and from New Caledonia, from which point we have heretofore secured chrome ore, may be diverted to other uses.

Rumors have been current in Washington for several weeks of lack of cooperation between the California chrome miners and the eastern metallurgical companies controlling the necessary electrodes. There were also reports that the War Industries Board refused to recognize the great supply of chrome in California and refused to order priorities allowing shipments of electrodes to the Western Coast. Recently several individuals interested both in the automobile business and the parts industry and also in the California chrome made thorough investigations, which were placed before the War Industries Board and practically forced them to move.

—

Hodgkins Resigns From Studebaker

DETROIT, March 27—R. T. Hodgkins, general sales manager of the Studebaker Corp. of America, has sent his resignation to the company, effective April 1. He has not announced his future plans yet.

Automotive Industries

Rumors Exaggerate Airplane Delay

Temporary Hold-Up Should Be Overcome in Next 90 Days—50 Engines Completed Last Week, 100 This Week—Makers in Production Within Next 60 Days—Many Derogatory Reports Misleading—Program Includes 22,000 Planes

WASHINGTON, D. C., March 26—Washington atmosphere is heavily charged with airplane delay rumors, and while the airplane program is behind schedule and while there have been delays the real situation is very frequently misinterpreted and unconsciously misrepresented. The entire airplane industry is so little understood in this country that it is not surprising that foolish rumors get wide circulation. Nobody connected with the airplane activity denies the delay in schedule, but the next 90 days should bridge what is now known as the delay period, and by that time production will be well under way in several factories, whereas to-day production is really under way in but one factory, and that factory is 90 days behind its schedule.

There are many reasons for delay, and while many of the public will be impatient with these they should give reasonable heed to them. Changes had to be made in the Liberty engine from the first design developed last July, and while the engine contained nothing new or untried the development of an airplane engine of its size was without precedent in this country or even in Europe, and many unexpected conditions arose from the greater production of power from the engine than was originally expected. At the start the engine was expected to show a little over 300 hp., but now it has shown over 400 hp., and naturally some parts that were designed on a 300-hp. basis are proving too light for the greater power output obtained.

Changes Were Necessary

In the original design the crankshaft oiling system was not a complete pressure system, and after testing some engines it was discovered that a complete pressure system was necessary. Such a change has been made. The greater power output has called for some heavier parts, such as strengthening the crankshaft and strengthening the connecting rods and wrist pins. A small change in some of these parts calls for changes in other parts closely related to them. There were some features of design that had to be changed, and it would have been a miracle if such changes had not had to be made. These changes have been exaggerated in some circles. There have been clerical delays in conjunction with these changes, and there has been a certain amount of lack of co-operation which has not been intentional but rather due to a rapid increase in organization and handling of certain work by men not familiar with airplane work.

Certain delays in manufacture have been caused by difficulties with materials entering into certain parts of the engine. The specifications of the steels have made some of these parts slow to produce and has resulted in a heavy rejection of parts by inspectors. This has been true with connecting rods and perhaps some other parts.

Picture Too Sanguine

Perhaps public criticism to-day is due very largely to the too sanguine picture of our airplane possibilities painted last spring after it was decided that the airplane was the eye of the army and that by great fleets of planes would it be possible to destroy the effectiveness of the Hun artillery and so destroy the effectiveness of the enemy. In those days there were stories circulated of fleets of 100,000 airplanes started by newspaper men rather than by those in charge of the airplane program. Other papers talked of fleets of 50,000 and others dropped in the scale to 25,000. Nobody at that time had the slightest conception of what it meant to produce a 400-hp. engine such as the Liberty, and even to-day it is a sad commentary that such a small percentage of our talking and gossiping public has so little information on what it means for a factory to get into production on such a job. This situation cannot justly be laid at the feet of any one official, as all agreed that secrecy must surround the development of the airplane, and during the months when this veil of secrecy was enveloping the nation there were millions of citizens unconsciously dreaming of those tens of thousands of airplanes that were to point the road to Berlin.

In those days no one thought of the I. W. W. activities in the spruce forests of the West and had any conception of how production of planes could be held back by the work of such forces. Nobody anticipated the railroad situation and the delays in materials caused by it. Nobody foresaw the pro-German activities that have destroyed machine equipment for factories. Nobody dreamed of the dangerous unknown traitor within our ranks who is responsible for a score of the evils that have crept into our factories. These all have contributed to the present regrettable quota of delay in which production is 90 days behind what it was scheduled for in the picture-painting days of last July and August.

Recent and present investigations of aircraft conditions are not, contrary to general opinion, directed against either Howard E. Coffin or the Aircraft Production Board as a whole. The above facts were brought out to-day in a conference with aircraft officials of this city.

Production Board Is Advisory

The Aircraft Production Board, of which Mr. Coffin is chairman, is really only an advisory organization. The laws incorporating it specifically state that the board must not duplicate any office or organization now existing in military or naval services. Therefore, also contrary to the public impression, actual production, inspection, accounting and contracting as regards airplanes for our military establishment reside in the hands of the Signal Corps, and if any one or any department is being investigated it is the Signal Corps with its commanding officer, General Squier. This above explanation clarifies the mysterious situation of the past few weeks wherein it appeared as if Mr. Coffin, who went to Detroit with the Snowden Marshall committee to investigate Detroit airplane conditions, was helping to investigate himself.

Conditions at this time can be described as follows: Fifty Liberty airplane engines were completed last week according to authoritative statements made here to-day, and nearly 100 Liberty airplane engines should be completed by the end of this week.

Army Well Equipped with Motor Vehicles

Ordnance Department Has Tremendous Supply of Trucks, Tractors and Trailers—Production Continues Steadily

WASHINGTON, March 25—The Ordnance Department, greatly expanded by the war urgencies, has developed a tremendous equipment of tractors, trailers and motor trucks to augment the military establishment. Forty-eight new 4-ton trailers have just been completed in design and will each carry complete equipments designed for making various repairs in the field and behind the lines, and these will soon be in process of production.

Special schools have been established at Rock Island Arsenal for equipment repairs, motor equipment repairs at Peoria, Ill., and supply work at several arsenals. Many of the commissioned and the enlisted personnel are having instruction at these schools and in addition a number of field artillery officers have been sent to acquire knowledge of motor equipment care to provide for emergencies that may arise in active duty.

There are eight heavy artillery mobile repairshops to an army, each consisting of two sections capable of independent operation, the general function being to make moderate repairs to heavy artillery and its motor equipment. Each section is composed of a repair and a supply organization.

Repair Subsection

The subsection, devoted to repair, is made up of three 3-ton trucks of the repair type called tool room trucks, air compressor trucks and forge trucks, and five 4-ton trailers of the machine shop type called generator, lathe, welding set, drill press and shaper and milling machine trailers. There are also provided a 4-ton crane trailer and a motorcycle with side car.

The supply subsection contains six 4-ton trailers of the supply parts type, which are completely housed and provided with bins of various sizes, similar to those in a stock room; six 3-ton trucks of the repair type for carrying large spare assemblies; two motorcycles with side cars, one solo motorcycle and one 1-ton delivery truck.

A complete section is further provided with one 4-ton trailer with machine shop body and two 3-ton trucks with repair body for transporting baggage; one 3-ton truck with repair body slightly altered and equipped with desks, files, etc., to be used as an office; one 3-ton truck of the ammunition type for carrying fuel in drums; one touring car and one rolling kitchen of the trail mobile type.

Each shop is commanded by a major assisted by one second lieutenant as adjutant. The commissioned personnel assigned to one section is one captain commanding; one first lieutenant in direct charge of the repair subsection, being assisted by a second lieutenant; one first lieutenant in charge of the supply subsection, records and files.

The enlisted personnel totaling 103 are of various grades from ordnance sergeant to private, acting in capacities of expert machinists, electricians, inspectors, mechanics, ignition and carbureter experts, blacksmiths, welders, assemblers, testers, chauffeurs, stockkeepers, helpers, etc.

For traveling purposes each of the twelve trucks of the repair type hauls a 4-ton trailer and the tank truck, the rolling kitchen, leaving the light delivery truck free for general purposes, the motorcycles being employed for dispatch and agent service.

Special Parking System

In the general scheme of operation the vehicles are parked so as to occupy three sides of a rectangle, leaving an end open for entrance of repair jobs to the park, the supply and spare parts trucks and trailers usually occupying one side, the power and machine tool trucks and trailers the other, leaving one end for the office and delivery trucks together with motorcycles and passenger cars. The personnel are quartered under canvas or such shelter as the commanding officer may direct constructed.

The generator trailer contains two 15 kw. D.C. generators, each being directly connected to a separate gasoline engine in order that one set may be overhauled without shutting down. A three wire system is employed giving a total output of 30 kw. for power and lighting.

The air compressor is directly connected with a 40 hp. gasoline engine identical with that installed in the trucks, and compresses 70 cu. ft. of free air per minute, delivered at 125 lb. pressure. A 100-ft. armored hose of 1 in. diameter is provided to deliver air to the appropriate hammers, chippers, etc.

The lathe trailer contains an 18-in. lathe with an overhead trolley chain hoist to handle heavy jobs.

Forge and Tool Room Trucks

The forge truck contains a large portable forge, anvil, rivet furnace, and a complete set of blacksmith's tools.

The tool room truck contains a 9-in. lathe, a bench drill, a combination cutter and drill grinder, and a complete outfit of small tools.

The welding set trailer is completely fitted with apparatus for oxy-acetylene welding, together with a low pressure acetylene generator of large capacity.

The drill press trailer contains a 21-in. drill press and a shaper, together with complete tool equipment.

The milling machine trailer contains a 9-in. lathe, a precision lathe, a milling machine, and a sensitive drill press, an optical repair chest for the repair and parts replacement of optical instruments.

The standard ordnance motor vehicles are as follows:

The *ammunition truck* consists of a steel body mounted on a four-wheel drive type of truck chassis. The body is designed to accommodate original packing boxes of any type of ammunition. This body will also conveniently carry five 55-gal. steel tanks for gasoline, oil and water supply. In general it is intended to use this body wherever an ordnance truck is required for heavy cargo purposes.

The *equipment repair truck* consists of a repair body mounted on a four-wheel drive type of truck chassis. The body is fitted with bins and chests of drawers for spare parts and raw material for repairing personal equipment, machine guns, pistols, rifles, leather equipment, etc. Machines for sewing leather and canvas, work benches, etc., are supplied, together with the necessary hand tools for making the above repairs.

The *artillery repair truck* consists of a small machine shop repair body mounted on a four-wheel drive type of truck chassis and constitutes a small repair shop. The equipment consists of a lathe, drill press, bench grinder, portable electric drill, oxy-acetylene welding outfit, air riveting hammer, milling attachment, blacksmith outfit, and an assortment of the necessary tools to repair artillery material and motor vehicles. Electric power is supplied by a small gasoline-driven generator mounted on the truck. It is intended to use this truck with possible minor variations in equipment wherever the service of such vehicle is necessary. This truck is ordinarily accompanied by an artillery supply truck carrying tools, spare parts, raw material, bar stock, etc., for use in connection with such repairs.

Artillery Supply Truck

The *artillery supply truck* in motorized batteries takes the place and carries the equipment of the battery and store wagons of what was formerly horse-drawn field artillery. The equipment consists of tools, spare parts, etc., pertaining to the particular type of cannon to which assigned. This vehicle is also used as a companion truck to the artillery repair truck wherever it may be used for carrying spare parts, material, etc.

The *artillery tractor, 2½-ton,* weighing about 5000 lb. and capable of crossing bad ground at a speed of 10 m.p.h., or developing about 12 m.p.h. under favorable road conditions, will be provided for handling the reel and cart attached to the battalion and regimental headquarters of motorized artillery regiments in place of the 6-horse team used in horsed regiments.

The *artillery tractor, 5-ton,* weighing about 9000 lb. and having speeds of 1½ m.p.h., 3 m.p.h. and 6 m.p.h., respectively, is intended for use with 4.7-in. gun and 6-in. howitzer material, each tractor hauling one-half a section or other loads not exceeding 10,000 lb.

Artillery 10-Ton Tractor

The *artillery tractor, 10-ton,* weighing about 17,000 lb. and having a low speed of about 1½ m.p.h., and capable of developing 4½ m.p.h. or a little better on high speed, is intended for use in motorized regiments of 6-in. guns or for loads weighing up to 18,000 lb., such as a large howitzer broken up into smaller units for transportation.

The *artillery tractor, 15-ton,* weighing 26,000 lb. and having speeds of 2⅛ and 3½ m.p.h., and the *artillery tractor,* 120-hp., weighing about 28,000 lb., and having speeds of 2⅛ and 3½ m.p.h., will be supplied in limited numbers. These tractors are of the track-laying type, similar to those used by the French and British Governments, and are used for handling heavy loads which are not subdivided for transportation.

The *reel and fire control truck* consists of a four-wheel drive truck chassis, having the

Digitized by Google

rear wheels replaced by caterpillar tracks to improve the ability to negotiate bad ground, and a wire reel, mounted on the rear end of the truck. Between the reel and driver's seat are located chests for carrying fire control instruments, on which a number of men may also sit. This vehicle will have a speed of 12 mph or better.

The *reconnaissance car* consists of a 1-ton rear drive type of chassis, having mounted upon it a steel body suitable for carrying from twelve to fourteen men with necessary storage space for fire control instruments. This car is capable of developing from 30 to 40 mph under full load.

The *light repair truck*, weighing about 7000 lb., consists of a small box body mounted on a light chassis. It carries chests containing carpenters' and machinists' hand tools, automobile tools and supplies, lubricants and greases, and is used for light emergency repairing and general utility work.

Anti-Aircraft Trailer

The *1½-ton anti-aircraft trailer* is supplied to transport the 75 mm. improvised anti-aircraft gun. Two trailers are used to transport each piece, one carrying the gun and cradle, and the other, the gun platform.

The *3-ton anti-aircraft gun trailer*, weighing about 4200 lb., is designed to have permanently mounted upon it a 75 mm. anti-aircraft gun. This trailer also carries a box containing ammunition.

The *3-in. field gun trailer*, weighing about 4400 lb., is so designed that 3-in. gun material and similar vehicles may be easily loaded upon it and transported at high speed behind motor trucks. After the guns are placed, the trailers will be available for bringing up ammunition, provided road conditions are favorable enough for their use.

Other trailers of various types are furnished for special purposes, which vary from those carrying corps repairshop equipment to those of sufficient capacity to transport tractors and tanks and damaged vehicles at high speed on good roads.

Tanks and other armored land vehicles are designed, procured and maintained by the Ordnance Department.

Varieties Minimized

While the Ordnance Department has probably had to design a greater variety and handle a greater volume of motor equipment than any other department of the Government, there has been a continuous and successful effort to keep the variety of vehicles and parts to the absolute minimum consistent with the necessities of the service and, unless absolutely impracticable to do so, to use parts already in service in France or used by some other branch of the Government.

There is, for example, only one size of tire used on all the heavier trucks and trailers, and this size is also used on similar vehicles by the Quartermaster Corps, Signal Corps and Engineers. One size of tractor uses in its engine practically every part of the B-engine used by the Quartermaster Corps.

Magneto Same on All Vehicles

The same magneto is used on all ordnance vehicles and in emergency is readily replaceable with the magnetos used by other departments.

Four sizes of standard tractors have been developed and adopted to meet the needs of the artillery service, and these tractors, when required by any other branch of the Army, will be supplied by the Ordnance Department to reduce the number of types.

All the types of the ordnance truck bodies are interchangeable on all truck chassis issued to the artillery, to facilitate changes in the field. Numerous other examples could be mentioned of the effort to keep parts to a minimum and effect co-operation between the departments of the Government.

Government Opens Schools

Several Departments Cooperate to Train Selected Men in Management of Workers

WASHINGTON, March 26—Various government departments co-operating in an intensive training course of employment management have established schools. The first will open to-day at the University of Rochester and others will soon open at Harvard University, Massachusetts Institute of Technology, Boston University and the Boston Employment Managers Assn. The first course will continue for 6 weeks, and include both the theory and practice of employment management. Fifteen Rochester factories have arranged to provide the laboratory work and assist the university in presenting the theory of personnel management.

Only men selected by manufacturers of war contract plants and who possess industrial experience, good education, liberal point of view and the ability to command men will be accepted. The Department of Labor is sending two of its field agents in the federal employment service, and it is announced that the Navy Department intends sending assistant superintendents from navy yards. Twenty prospective employment managers have already been accepted and enrolled.

Purpose of Plan

The purpose of the plan is to add a fourth general division to every industrial enterprise personnel, consisting of employment or service management. This department will cover all those activities which have to do with human relations; legislation, safety, education, recreation, "hiring and firing," discipline, wage system, pensions, sick benefits, etc., bringing them all under one department.

Although this type of work is new, it had some development before the war, and during the last three years an association of employment managers was organized in Boston, Detroit, Philadelphia, Chicago and Cleveland. A representative of the Industrial Service Section of the Ordnance Department has remarked that all cases of labor difficulty which have been brought to their attention could have been avoided if the factory in question had already established a modern employment department. The Quartermaster Department cites an instance where two mills, side by side, working on the same type of material and employing the same sort of labor, got totally different results from the workers. One had a well-conducted employment and service department and the other had not. The former got better results all around and avoided strikes, although it paid a slightly lower wage. This, it is claimed, was due to the fact that justifiable complaints were attended to by the employment department as they arose.

The co-operation of manufacturers is desired in that they send carefully selected students to the course. Organizations desiring to send students should apply to Captain Boyd Fisher, 5207 New Interior Building, Washington, D. C., who represents the several departments co-operating.

—

230,000 Men in Shipbuilding

WASHINGTON, March 25—Shipbuilding in American yards is now employing 230,000 men, and as yet there has been no shortage of labor except of highly skilled men, according to a statement by the Department of Labor. Within the next 6 months 150,000 more men will be needed, and these will be obtained from the ranks of the unemployed and the United States Public Service Reserve, which has more than 225,000 men enrolled.

—

Italy's Exports Almost Doubled

TURIN, ITALY, March 20—Exports of automobiles and trucks from Italy during the first 10 months of 1917 amounted to more than $20,000,000, and included 916 trucks and 614 cars. This is an increase of 92 per cent over 1916. During the same period Italy imported 251 vehicles at a cost of $251,000, which is only one-fourth of the amount imported in 1915.

Detailed figures follow:

Exports for 10 Months Ended Oct. 31

Year	Number	Value	Increase over Previous Year
1917.....	8,530	$22,453,361	92 per cent
1916.....	4,936	12 110,870	19 per cent
1915.....	3,879	10,113,355	

Imports for 10 Months Ended Oct. 31

1917.....	251	$251.000	60 per cent*
1916.....	319	638,705	40 per cent*
1915.....	386	1,027,892	

*Decrease.

Trucks for Food Shipment

WASHINGTON, D. C., March 22—An appropriation for $100,000 for experiments in utilizing motor trucks for shipments of food to large cities, authorization to the Secretary of War to turn over to the Postmaster General for use in mail transportation all airplanes and automobiles unsuitable for military purposes and a recommendation to charge 24 cents per ounce for airplane mail were contained in the Post Office appropriation bill approved Tuesday by the full Senate committee which has ordered the bill favorably reported.

$875 for Ford Tractor with Plow

War Preparedness Board Fixes Price for Michigan After Conference

LANSING, MICH., March 27—A price of $875 for the tractor sold by Henry Ford & Son to the State of Michigan has been fixed by the war preparedness board, after a consultation with representatives of the Oliver Plow Co., South Bend, Ind., and Henry Ford & Son, Dearborn. This price includes the two-bottom plow.

Prior to the consultation, the price set on the Oliver plow was $97, arranged by Ford without the sanction of the plow company. It was explained to the war board this price was for a foreign contract, and was a flat price without any repairs, service or demonstration. With the price fixed at $125, the company agrees to send experts into the field and see that every plow works properly.

—

Restrict Building Plans

WASHINGTON, March 25—All companies that plan building construction or new enterprises or enlargement of industries that are not needed in the prosecution of the war will meet with serious opposition from the Government. Such businesses will be unable to secure labor, material or capital. Power has been given the Secretary of the Treasury to approve or veto new capitalizations.

—

Chicago Accessory Show a Success

CHICAGO, March 25—The third annual motor car accessory show staged last week by Rothschild & Co. was a complete success, not only in attendance, but in amount of business done. Tires, usually one of the biggest items to go at a show, were apparently of secondary importance, and the strongest buying was for storage batteries, anti-glare lenses, spotlights, etc., while body polishes, paints, oils, etc., came next, accounted for by the overhauling season. The special accessory department for Fords, including parts, did a large volume of business.

—

Changes in J. & D. Tire Co.

CHARLOTTE, N. C. March 25—F. Smith, one time Eastern sales manager for the Jeffery Motor Car Co., superintendent of branch houses for the Maxwell Motor Car Co., and until recently secretary and sales manager and one of the organizers of the Briscoe Motor Car Co., is now identified with the J. & D. Tire Co., of this city, in active charge of sales. R. L. DeLissor, formerly branch manager of the Columbia Motor Car Co. and assistant sales manager of the Briscoe Motor Car Co., has been appointed Eastern sales manager. H. O. Smith remains as president and factory manager, with C. M. Downs superintendent in charge of production. The present capacity of the factory is 500 tires a day. Heretofore J. & D. tires have been sold almost exclusively through the South, but arrangements are now being completed to establish sources of distribution in the East and Middle West.

—

Liberty Loan Committee for New York Dealers

NEW YORK, March 25—New York dealers have lined up their Liberty Loan drive committee. Charles M. Brown (Winton) is chairman and he has appointed the following: Charles E. Miller, vice-chairman; R. H. Johnston (White); C. S. Hare (Packard); F. G. Cavill (Marmon); A. G. Southworth (Buick); Charles E. Reiss (Hupmobile); W. A. Woods (Peerless); W. C. Poertner (National); H. J. De Bear (Maxwell); I. M. Uppercu (Cadillac); C. H. Larson (Oldsmobile); C. Lescaris (De Dion); J. F. Plummer (Liberty). J. C. Nichols, Louis Mansbach, W. A. Allen and F. W. White will represent the accessory trade. The tire dealers will work with the rubber trade committee.

—

American Die Casting Reorganized

INDIANAPOLIS, March 25—C. D. Cutting, J. H. Armstrong, R. W. Smith and F. D. Tobin, of the C. A. S. Engineering Co. of Detroit, together with E. Barton Hall, formerly director of purchases of the Curtiss Aeroplane & Motor Corp., have bought an interest in the American Die Casting Co. of this city. The company has been completely reorganized and its capacity tripled. The new officers are: Lawrence Olson, president; E. Barton Hall, treasurer; C. D. Cutting, secretary, and W. L. Jenks, assistant treasurer.

—

Harry Bill Winton Factory Manager

CLEVELAND, March 26—Harry L. Bill has been appointed general factory manager of the Winton company. He was formerly factory manager of the Chalmers Motor Co. and more recently manager of the experimental station plant of the aircraft board at McCook Field, Dayton.

—

Hal Assets Exceed Liabilities

CLEVELAND, March 27—The schedules in bankruptcy of the Hal Motor Car Co. which have been filed in the Federal Court fix the company's liabilities at $222,180.77 and its assets at $232,291.67.

—

Tractor Demonstration for Michigan

GRAND RAPIDS, March 26—The Tractor and Implement Dealers of West Michigan will conduct a public exhibition and demonstration of power farming machinery here on April 23, 24 and 25. Twenty-five acres of land have been obtained, and several shelter tents will be erected, as well as a large tent in which lectures will be given by agricultural experts and county agents.

Car and Truck Prices Increase

Reo Drops 2-Ton Truck—Deering Sets Price—Crow, Baker and Saxon Advance

LANSING, MICH., March 27—The Reo Motor Car Co. will discontinue production of its 2-ton truck. The company has received a contract from the Government for creeper-type tractors, and until the order is completed only one model truck, namely, the ¾-ton light delivery vehicle, will be manufactured. When the Government's needs have been taken care of the Reo company will probably resume production of heavy trucks.

Truck prices will be increased as follows on April 1:

Model	Old Price	New Price	Increase
Complete with body	$1,175	$1,275	$100
Truck chassis.....	1,100	1,175	75

—

$60 Increase on Crow-Elkhart Cars

ELKHART, IND., March 26—The Crow-Elkhart Motor Co. has increased the prices of its models $60, as follows:

Model	Old Price	New Price
2—Pass. roadster	$935	$995
5-pass. touring	935	995
De luxe roadster.....	995	1,055
De luxe touring.....	995	1,055

The price of the sedan was not changed.

—

Price of Deering Magnetic Fixed

CHICAGO, March 25—Prices of Deering Magnetic cars have been definitely fixed by the Magnetic Motors Corp. They are:

Model	Price
7-pass. touring.....	3,950
4-pass. roadster.....	3,950
Coupe	4,850
Sedan	4,950

—

Baker Electric Price Increase

CLEVELAND, March 26—The Baker R. & L. Co. will increase its factory prices on April 1, as follows:

Model	Old Price	New Price	Increase
Brougham ...	$3000	$3150	$150
Coach-type ..	3200	3400	200

—

Saxon Six Advanced $50

DETROIT, March 26—The Saxon Motor Car Co. will increase the factory price of its 6-cylinder touring car $50 on April 9. The new price will be $1,045. The price was increased from $935 to $995 on Feb. 10. The 4-cylinder model has been discontinued.

—

International Harvester Classes

CHICAGO, March 25—The high schools here are co-operating with the International Harvester Co. to train 1500 boys for farm work this summer. The boys receive elementary instruction in the principles and operation of gasoline en-

Digitized by Google

gines and the adaptation of the engine to farming in the classroom. In the afternoon, the class goes to the display rooms of the International Harvester Co. and receives practical instruction in the care, operation and construction of farm machinery.

The course has been going on for several weeks and will continue until May 1. A. S. Marlow, in charge of the retail farm operative equipment department of the company, takes charge of the classes in the display room, and lectures on tractors.

—

Germany vs. Daimler Co.

AMSTERDAM, March 20—Proceedings against the Daimler Co. on a charge of war profiteering have been started in the Stuttgart Provincial Court, Germany. It is alleged that the company charged German military authorities exorbitant prices, and, despite its excessive profits, recently demanded increased prices. The company claims that its profits are due, not to excessive prices, but to rapid turnover.

—

Wilmington Aid for Truck Trains

WILMINGTON, March 25—The police department of this city has arranged to meet all government truck trains passing through here and escort them over the best route. A motorcycle policeman meets the train at the point of entrance to the city, when notification of its coming is received, and accompanies it to the point of exit. When the trains remain over night, the police take care of the trucks and the Y. M. C. A. houses the men.

—

Build "National Defense Highway" Immediately

WASHINGTON, March 25 — Immediate construction of the "National Defense Highway" from Washington to Annapolis is provided for in a bill introduced in the Maryland State Senate by Senator Metserott. The work of construction is to be commenced at Bladensburg, where the road will connect with the Washington-Baltimore Boulevard. The need of this road as a defense measure is in its connecting the Naval Academy with the Capital. The road will be 30 miles long and will be called the National Defense Highway.

—

To Improve Dixie Highway

DETROIT, March 25—It is planned to start improving the Dixie Highway north of Monroe as soon as the weather permits. The Monroe-Toledo road is the only exit for motor vehicle travel south and east of Detroit, and it has been almost impassable of late.

—

Liberty Hydro-Airplane in Test Flight

WASHINGTON, March 23—The navy hydro-airplane equipped with a Liberty engine made another official test flight here yesterday, accompanied by several other hydro-airplanes. The plane equipped with the Liberty engine quickly outdistanced the others, and the test was announced to be highly satisfactory.

Call 5000 Men for Airplane Work

Draft Registrants in Middle West to Have Thorough Mechanical Training

WASHINGTON, March 25—Five thousand draft registrants will be called this week to assist in the maintenance of America's air fleet. A call has been made for men from Illinois, Minnesota, Iowa and Indiana. A thorough training course in woodworking and gas engine operation and repair will be given these men at 14 educational institutions selected by the Government.

Voluntary induction will be tried, but where the states fail to produce the required quotas, men will be conscripted. Registrants must have at least a grammar school education to their credit. Assignments to duty will be made according to ability shown.

The schools and quotas of each state follow:

Minnesota, 1820 men; 300 to Carnegie School of Technology, Pittsburgh; 500 to University of Cincinnati; 500 to University of Minnesota; 189 to Pennsylvania State College and 330 to University of Pittsburgh.

Illinois, 700 men; 100 to University of Chicago; 200 to Lewis Institute; 100 to Northwestern University; 300 to Bradley Polytechnic Institute.

Iowa, 2200 men; 100 to New York University; 400 to Wisconsin University; 500 to the Auto and Tractor School, Kansas City, and 500 to the Sweeney Auto School, Kansas City.

Indiana, 500 men to Purdue University.

The above schools have been selected following thorough investigation of the country's educational institutions by the Federal Vocational Board.

—

Miller Rubber Selling Treasury Stock

AKRON, OHIO, March 27—The Miller Rubber Co. is offering 6000 shares of treasury stock for sale at par to present holders of common stock in the ratio of one share for every six held. The company is carrying an inventory which is $1,600,000 larger than normal, according to reports, and expects to do a business of between $15,000,000 and $17,000,000 during 1918. The additions being erected to the Miller plant are almost completed.

—

Combat Plane Production Slow

WASHINGTON, March 25—The House Military Affairs Committee in conference with the War Council this week learned that production of combat planes was behind schedule. Contractors have been unable to keep up with the demand, and it is difficult to tell when the scheduled supply will be obtainable.

—

Chicago to Have General Accessory Show

CHICAGO, March 25—The accessory show which was held in the Coliseum last fall and which then was known as the "Ford accessory show" is to be held again this September, but this time the name Ford will be dropped, and it will be a general accessory exposition.

It is expected that it will be held in the Municipal Pier and not in the Coliseum. The pier is much better for show purposes and there is more room.

—

Continue Federal Aid Road Construction

WASHINGTON, March 25—The theory that Federal aid road construction will not be sanctioned during the war has been exploded by the fact that the Government has fixed the price of cement for this work. Cement plants at Hannibal, Mo., and Iola, Kan., are required to deliver cement to the Government at $1.50 a barrel during the first 4 months of 1918.

—

Mid-West S. A. E. Meets

CHICAGO, March 23—A talk on the work of the Signal Corps by Col. L. D. Wildman, chief signal officer, Central Department, U. S. Army, and an illustrated lecture on motion pictures as a selling medium for automotive products by Wm. Lehle, president of the Commercial Motion Picture Mfg. Co., Chicago, comprised the program at the meeting of the Mid-West section of the S. A. E. last evening.

—

Air-O-Flex Re-elects Officers

DETROIT, March 25—The Air-O-Flex Automobile Corp. has re-elected the following officers: President, G. M. Walker, Jr.; vice-president and chief engineer, O. C. Kreis; secretary, Charles D. Lehmkuhl; treasurer and consulting engineer, Robert A. Weinhardt, and general manager, A. B. Hanson.

—

Racine Dealers Have First Show

RACINE, WIS., March 25—The Racine Automobile Dealers' Assn., organized several months ago, held its first annual show in the Municipal Market Building on March 21, 22 and 23, with excellent results. Formerly the shows were conducted under private auspices, and had little support. There were exhibits by 14 dealers and 6 accessory and supply firms.

—

Louis Seguin Dead

PARIS, FRANCE, March 1—Louis Seguin, chairman of the board of the Gnome & Le Rhone Engine Co. and a pioneer in the development of aviation engines, died here on Jan. 7. He was a grandson of Marc Seguin, the French engineer who invented the water tube boiler.

Louis Seguin in 1895 organized the Gnome Engine Co., which developed the Gnome and later the Le Rhone rotary aircraft engine.

—

$188,000,000 for Navy Flying Service

WASHINGTON, March 22—Congress has appropriated $188,000,000 for the flying service of the United States Navy. This is three times the amount of the total appropriations already made for this service, making a total of $248,000,000 for naval flying operations.

France Decides to Market Alcohol

22,000,000 Gallons to Be Sold After the War for Use of Automobiles Only

By W. F. Bradley

PARIS, March 1—Immediately after the war it is the intention of the French Government to put on the market, for the use of automobiles only, a quantity of not less than 22,000,000 gal. of alcohol. This cannot be used alone in the present type of internal combustion engine, and as there is no desire to change the engine to absorb the new fuel, suitable mixtures will have to be made with this alcohol. It is estimated that after the war there will be available a total quantity of 15,000,000 gal. of benzol. The dyeing industries and perfumery makers will require 3,500,000 of this, leaving 11,500,000 available for automobile use. A mixture of 50 per cent alcohol and 50 per cent benzol is suitable for engines as they exist at present with no other changes than slight modifications to the carbureter. The General Omnibus Co. of Paris made use of this mixture for two years with very satisfactory results, only abandoning it owing to the fluctuations in the price of alcohol.

Alcohol Not Soluble in Gasoline

On a 50 per cent mixture the supply of benzol will not be sufficient to absorb all the alcohol available, and it is impossible to mix the alcohol with gasoline owing to the fact that alcohol is not soluble in gasoline. If the two were used together the gasoline would be used up first, leaving a fluid too rich in alcohol to be suitable for the carbureter.

The Paris Compagnie Générale des Voitures, which controls most of the taxicabs of Paris, has discovered, however, that a very suitable mixture can be obtained by 50 per cent alcohol, 25 per cent benzol and 25 per cent gasoline. The benzol will dissolve both the alcohol and the gasoline, making a homogeneous mixture. On this basis the whole of the 22,000,000 gal. of alcohol which could not be absorbed completely owing to the limited supply of benzol can be made use of in present type motors.

Before the war France imported 66,000,000 gal. of gasoline, most of this coming from America. It is estimated that the quantity required during the first year of peace will be 132,000,000 gal., and as the great increase in the use of automobiles in America makes a further supply from the United States somewhat doubtful, the authorities are seeking as far as possible to assure a home supply. There is practically an unlimited supply of alcohol available from France and the French colonies, but as is well known, this fuel cannot be used alone without important modifications in the present type of engine, and it cannot be mixed with gasoline. This reduces the French to a mixture of alcohol and benzol, which is already well known and was used to quite a considerable extent before the war. Under the Government plan, which consists of a State monopoly of alcohol, steady prices will be assured and important users of automobiles will be induced to adopt this fuel. As a compensation and as a steadying influence against variations in the supply of alcohol produced from beets, there is synthetic alcohol now being produced by the calcium carbide factories in the Alps and other mountainous districts of France. By reason of the war these factories have been obliged to enlarge to an enormous degree, and although not able at the present time to produce synthetic alcohol in any great quantities, they would be in position to produce it under very economical conditions on the return of peace.

Before the war France produced comparatively little benzol, and although this fuel was used exclusively by Paris taxicabs most of it was imported from Germany and from England. Since 1914 the gas companies have been obliged to extract the benzol from the coal treated by them. This extraction reduces the calorific quality of the gas, but not, however, to a very serious degree. It is not thought that the Government will allow the benzol to be left in the gas immediately peace conditions return. Supposing only 20 grammes of benzol per cubic meter are withdrawn, there will still be a total supply in France of 15,000,000 gal.

In 1913 France produced 66,000,000 gal. of alcohol at 100 deg.; in 1914 this dropped suddenly to 44,000,000 gal., and in order to meet the shortage purchases had to be made abroad. No figures have been issued for 1916 and 1917, but it is officially stated that for the preparation of powder alone the army consumes 176,000 gal. of alcohol per day.

—

Tank Production Increases

DETROIT, March 26—The United States is going into tank production on a scale hitherto undreamed of, and great numbers of American tanks in several different types for various kinds of fighting are being rushed to completion in many factories in the East and Middle West.

Two hundred men are needed for two New York tank companies. They may be from 18 to 41 years of age, draft age included, and need have no mechanical knowledge. The personnel of a light tank company consists of a captain, 4 lieutenants, 19 sergeants, 27 corporals, 2 cooks and 50 privates. A heavy tank company consists of a captain, 20 lieutenants, 45 sergeants, 43 corporals, 5 cooks and 144 privates.

—

Ford Loses State Tax Lawsuits

DETROIT, March 25—The Ford Motor Co. lost its fight to avoid payment of the California franchise taxes when the United States Supreme Court upheld the local Federal Court. This court had dismissed proceedings of the Ford company to restrain the state from collecting the franchise tax.

200 French Makers at Lyons Fair

Automobile Participation the Main Feature—Gives Evidence of Post-War Plans

By W. F. Bradley

LYONS, FRANCE, March 4—The City of Lyons opened its third annual trade fair this week with 3800 exhibitors, compared with 2614 in 1917. The Lyons fair was inaugurated in direct rivalry to the one at Leipzig, and has been so successful that it is doubtful if the German exhibition will ever regain its importance. It is claimed that last year the value of the business transacted at Lyons exceeded $40,000,000, this being done under adverse conditions of weather and with transport congested to a very serious degree.

Outstanding Feature

The outstanding feature of this year's fair is the automobile participation. Two years ago there were no automobile makers in the Lyons show. Last year the French Syndicate of Automobile Manufacturers officially boycotted the fair by sending an intimation to all its members that they must not take part in the event. The great majority accepted this advice as an order, although Lyons automobile manufacturers refused to be dictated to. The result was that only local firms, such as Berliet, Rochet-Schneider, Luc Court, Zenith, etc., and agents for American cars held stands at the fair.

Different Policy This Year

This year the French Syndicate has adopted an entirely different policy, for not only are 200 manufacturers exhibiting, but the syndicate has its own hall, and it has sent down its general secretary, Henry Cezanne, who was general manager of all the later Paris automobile salons, to be chief commissioner of the motor section of the Lyons fair. This indicates a desire on the part of the whole French automobile industry to prepare as early as possible for after-the-war conditions. It is also an abandonment of the narrow policy of jealousy which sought to kill all other exhibits than the one in the Grand Palais, Paris, and which obviously cannot be held again until after the war.

To Erect Permanent Building

As an indication of the permanent success of the Lyons fair, it has been decided to build a permanent building to cost not less than $5,000,0000, capable of holding 5000 exhibitors, and having an area of 1,287,000 sq. ft. Plans of this hall have been prepared and constructive work will begin at an early date.

Last year there were exactly 100 exhibits in the automobile section of the Lyons Fair, and the official American stand was at the head of the section. The American exhibits this year were scattered.

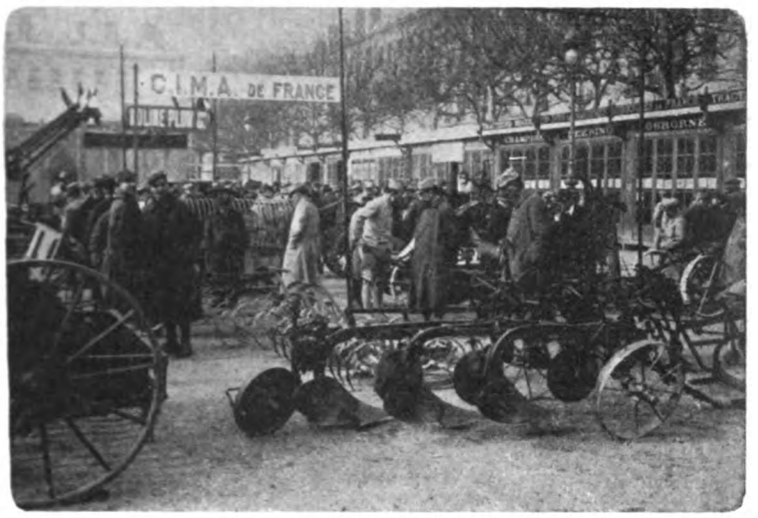
The Outstanding Feature of the Lyons Fair—The Automobile Exhibit



Syndicate of French Manufacturers Has Its Own Hall, Containing 200 Displays

The automobile exhibits were housed in an attractive one-story building, with stained glass windows and clusters of flags at regular intervals

Here is one of the cars fitted with a small tank to run on gas. The registration number is painted on the sides and the cowl

American plows were a source of great interest to the soldiers who visited the fair

The Rochet-Schneider exhibit included a truck chassis, two cars and a body. Note the steel wheels on the truck

Each exhibit was partly roped off, contrary to American custom. Trucks, cars and chassis were exhibited side by side

Gray & Davis, Inc. Pays All Its Debts

BOSTON, March 25—Gray & Davis, Inc., which went into the hands of a creditors' committee Nov. 24, 1916, paid off its last claim Saturday and to-day is free and clear and carrying on a good business.

The total debts to banks and merchandise creditors when the committee was named amounted to $2,550,000. It was paid in 12 equal payments. The period of payment covered only 16 months.

While the company is devoting a large part of its facilities to munitions work the starter and lamp business is still maintained, and last year amounted to $2,500,000.

—

May Embargo Exports to Canada

WASHINGTON, March 27—An embargo or at least licensing of automobiles shipped from the United States into Canada, is being considered by the Canadian War Board. This creates a serious situation owing to the fact that Canada is importing more than $16,000,000 worth of American automobiles a year. At present the National Automobile Chamber of Commerce is endeavoring to counteract the embargo propaganda by education of the public of the value of motor cars by publicity scattered through the civic organizations of Canada. This education campaign has been planned and in operation for several months for officials of the industry here have foreseen the possible transfer of anti-automobile agitation from the United States to Canada.

California Tractor Demonstration Covers All Farm Work

SAN FRANCISCO, CAL., March 21.—What is described as educational tractor demonstrations will be held under the California Tractor and Implement Association on the University farm at Davis, Cal., April 17, 18 and 19. The demonstrations and expositions will be entirely educational in character, and will be immediately under the supervision of the Society of American Agricultural Engineers.

The list of the different tractors that are to demonstrate has not yet been made public. The rules covering the demonstration provide for plowing for 1½ hr. each afternoon, harrowing for 30 min. and other activities for 1 hr. The mornings will be given over to private demonstrations and in these all plowing must be at a depth of 8 in.

The rules provide that not more than one tractor of a size and model will be permitted to operate during the public demonstration. Those companies or individuals demonstrating must be members of the California Tractor and Implement Association. Some of the rules governing the demonstrations are as given below.

Studebaker Distributers Take Over Two Branches

SAN FRANCISCO, March 25.—Effective March 15, the C. N. Weaver Co., Studebaker distributer, takes over all the territory of the San Francisco Studebaker branch. This includes northern California as far south as Porterville and the western half of the state of Nevada. The C. N. Weaver Co. has been Studebaker distributer since 1913. C. N. Weaver, president of the company, was formerly an employee of the Studebaker Corp., having been connected with this firm for nearly 25 years. For several years before Studebaker began the manufacture of automobiles he was the manager of the vehicle branch at San Francisco and continued as automobile manager until he took over the dealership in 1913.

At the same time the F. L. Shaw Co., Studebaker distributer at Dallas, has taken over the Dallas branch of the Studebaker Corp. with the exception of the new Mexico territory, which will be transferred to the Kansas City branch.

—

First Standardized War Truck Convoy En Route

WASHINGTON, March 28—The first standardized war truck convoy, which left Lima, Ohio, late last week, is nearing Chambersburg, Pa., and will arrive in Baltimore Friday night. The trip to date has been without a mishap of any kind.

Rules of California Tractor Demonstration, April 17, 18 and 19

1. In the afternoon of each day public demonstrations will be held, divided into three periods as follows:

Plowing	1:30 to 3:00
Harrowing	3:00 to 3:30
Stunts	3:30 to 4:30

Private demonstrations will be held in the mornings on the portion of the field allotted for that purpose, also during the "stunt hour." Each public and private allotment shall be entirely under the control of its owner, except that all plowing must be done to a depth of at least eight inches, measuring the furrow wall. Re-working of ground already plowed in public demonstrations will be permitted on Thursday and Friday mornings and Wednesday, Thursday and Friday afternoons between 3:00 and 3:30.

2. Not more than one tractor of a size and model will be permitted to operate on the field during public demonstration. Extra equipment or slight variation in design are not to be interpreted as distinguishing different size or model. During the public demonstration no tractor will be permitted in operation in any other part of the field.

3. Size of land allotted to each tractor exhibitor for private demonstration and for public demonstration will be determined by the average width of plows which they undertake to pull.

4. All exhibitors will be allotted land in the same field or adjoining fields during each day's demonstration. (It appears on this date, March 16th, that each exhibitor will be allotted one field for private demonstration and one field for public demonstration. The private field will serve for special demonstrations during the mornings, sufficient area being reserved to plow in the public demonstration Friday afternoon. The field allotted for public demonstration will be half plowed on Wednesday afternoon and the other half on Thursday afternoon. This cannot be definitely determined until all entries are in).

5. All plows on any given gang must be set at the same depth and kept there during the demonstration period. This depth must be at least eight inches. Plows found operating otherwise will be ordered from the field for the balance of the day's work.

6. In all public demonstrations the motor of tractor must not be run at more than 10 per cent above its catalog speed.

7. Positions on field first day will be arranged by lot. Each exhibitor will be required to finish his land daily in a workmanlike manner and assist in plowing the end lands as directed by the general manager.

8. Each field will be surveyed and staked ready for each day's demonstration.

9. Each tractor shall bear a placard showing the brake horsepower of the engine, the revolutions per minute, the plowing speed in miles per hour, and the kind of fuel used and its Baume test. Tractors using more than 5 per cent of gasoline shall be classed as burning gasoline and be so placarded.

10. All tractors on the demonstration field belonging to one exhibitor must be kept on or along the land allotted him for that day's demonstration, until the hour designated by the management for returning to headquarters.

11. No machine will be allowed to operate with special equipment other than designed for practical use with same. No spectacular methods will be permitted on the part of salesmen or others to attract crowds. The demonstration must speak for itself.

12. Each tractor exhibitor will have the privilege of burning any kind of fuel he desires but no one will be permitted to burn fuel of a higher gravity test than that used by his competitor burning the same kind of fuel. All exhibitors will be required to obtain fuel from source designated by general manager.

13. Manufacturers will be privileged to make turning tests or tests of drawbar pull of their tractors during any day of demonstration, but if submitting to these tests, which will be conducted by the University of California, they thereby agree that the results may be made public. These tests must be made in forenoons, or following public demonstrations afternoons.

14. The interpretation and enforcing of these rules shall be left to the field manager of the demonstration under the direction of the committee.

15. Each company exhibiting at this demonstration shall appoint one manager who will be expected to report to the general manager not later than 8:30 o'clock each morning for instructions and information regarding the day's work. This manager of exhibits will be held accountable for the work of his company, and no instructions will be issued to any one else, nor will requests, instructions or complaints be recognized from any one but this exhibit manager. He shall wear a badge furnished him specifying his being official exhibit manager.

16. Each exhibitor will be expected to keep plows, tractors, etc., around his tent arranged in first-class order, and the land allotted to him for exhibiting purposes free from circulars, rubbish, etc., such as will be distributed around headquarters daily. They will also be expected to use care at all times in operating machinery in respect to its safety for all visitors. The management will appreciate co-operation of these exhibit managers in all matters.

17. Each entrant will sign the rules and hereby agrees to live up to the rules and co-operate with the committee in every way to make the tractor demonstration a success.

18. No companies or individuals are eligible to demonstrate unless they are members of The California Tractor and Implement Association.

19. It shall be against the rules and regulations for any tractor manufacturer to put on an exhibit on the street corners of the city where the tractor demonstration is held, or to do any other thing in the way of exhibiting machines that would detract from the tractor demonstration and the regular established exhibits in the tents.

20. Exhibitors of machinery to be driven by belt power will be permitted only in the exhibit tent, not in connection with the field demonstration or exhibitors' headquarters tents in the field.

21. During Saturday the members of the Association will come to the campus of the university as guests. A plot of ground will be given to the association, which plot of ground will be at the disposal of the Demonstration Committee. The members of the association are individually bound to comply with the one rule that the university has made —i. e., there shall be no sales efforts of any sort on the property of the University of California on Saturday. All exhibiting members are obligated to see that their entire sales force observes this rule. It will be permissible to take the names and addresses of prospective customers, but it will be against the spirit of this regulation to go further. All exhibiting members are expected to appear in the parade on Saturday afternoon, with every available tractor.

Rumors Exaggerate Airplane Delay

(Continued from page 651)

At present the Packard company is producing practically all of the Liberty airplane engines. The Lincoln Motors Co. will be ready within 60 days. Their original schedule called for beginning of production April 1.

It is expected that the three General Motors plants will be in production within the next 30 to 40 days. In other words, all of the companies are rapidly approaching the state which they should have attained from 60 to 90 days sooner, and we should see quantity production of Liberty engines by mid-summer.

The Aircraft Board has for its functions the co-ordination of Army and Navy flying requirements, and operates also as a clearing house for the industrial airplane problems. The real causes for the delay come from the over-optimistic view of manufacturing conditions that was taken a year ago when the airplane program was laid out and before fuel shortages, transportation troubles and difficulties with priorities this last winter were experienced. Every company manufacturing war supplies demanded priorities, with the result that most industries vital to the war suffered. The aircraft officials frankly admit that they did not conceive of the difficulties of the past winter in their program, and that this was the cause of the exaggerated predictions.

Many Reports Misleading

With regard to the recent criticisms published throughout the country of the Liberty engine and the airplane program, it can be said that many of these reports are untrue. For example, in a recent report published in New York City it was said that the Liberty airplane which fell at Mineola suffered the accident because of a broken crankshaft. As a matter of fact, the crankshaft was bent as a result of the fall, and was not the cause of it. It is on view in Washington, and is the proof in itself of the falsity of the report. The real reason for the accident is known in military circles. It is one that does not reflect in any way on the Liberty airplane engine, but which cannot be told here because of the objection of military authorities.

The report that a Bristol plane equipped with a Liberty engine refused to leave the ground at the Curtiss plant at Buffalo did not tell the complete story. It failed to include the fact that minor mechanical troubles such as is often found in a new automobile or motor truck was the cause of the difficulty. When this was remedied, the airplane flew perfectly and is giving excellent service now.

The reports have also dwelt with inefficiency, so-called, at the Curtiss factories. The report stated that the company had failed to produce a single battleplane so far, and that it was producing bombing planes very slowly. It added that the company was 74 per cent behind schedule.

Authoritative statements, made in answer to these charges, say that the Curtiss company is not behind schedule. When it was taken over by the Willys-Overland Co., and negotiated with the Government, it was told to make training planes only, as they were needed most urgently. It entered into training-plane engine tooling and production. More than 1100 training planes have been turned out this month by the Curtiss and Willys-Overland organizations.

Planes Well in Hand

The company has also produced a number of bombing planes, but these have not been finished because the engineers of the Signal Corps, according to company officials, have not yet designed the bombing attachments. The company states that it is ready to produce fighting planes as soon as it gets Government contracts for them.

Snowden Marshall's committee is visiting Buffalo this week, and is making a thorough investigation of the Curtiss plant.

Major-General Leonard Wood before the Senate Military Affairs Committee said that we should use foreign engines in our planes because they have been tried. He criticized the Liberty airplane engine, but investigation here to-day failed to reveal any specific knowledge that he has about the Liberty engine other than that which he obtained abroad. No great importance has been attached to his statements.

The conference to-day developed many other facts. It was shown that 22,000 airplanes are included in our program, of which 7000 will be training planes. Eleven thousand will be made here of three types, including the Bristol machine, which is a two-seater, fast and light, and carries machine guns and photographic equipment but no bombing apparatus. The Day Bomber, which is a general-purpose machine, similar to the de Haviland type used by England, and which carries machine guns, bombing apparatus, photographic equipment, and is used for fighting and scouting both, together with the Night Bomber, capable of carrying heavy loads of explosives and somewhat similar to the huge Caproni with more than one engine and used principally for making night raids, are also included. The remaining 5000 planes in the program are those ordered from France and Italy last August to be furnished directly to our soldiers at the front. Italy, owing to the great German offensive, has been unable to live up to its program and the schedule for this 5000 has fallen somewhat behind.

The greatest problem we will have, according to Howard E. Coffin, will be the question of shipping tonnage. One airplane with its spares requires two crates 7 ft. x 8 ft. x 7 ft. x 40 ft. long each, and it is questionable that the shipping tonnage will be available when quantity production begins. The French Government when we entered the war suggested that we build no airplanes on this side but provide the materials and workers to France and England instead. Reports here indicate that this has been done to a surprising extent and that many thousands of our men are working at allied factories. There are also other reports to the effect that in the near future American-built airplanes will be flying on the battle front that will have been made by American workers out of American material in American factories in France and England. It is also likely in event that shipping tonnage is not available that all of the fabrication work will be done in this country and the assembling abroad.

The Aircraft Board states that there is no trouble at this time either with materials as regards quantities or with labor, although it is very likely that in the near future, when quantity production is reached, there will be a shortage of highly skilled workers.

Fuel Oil Distribution Rules Revised

WASHINGTON, March 26—Rules governing the distribution of fuel oil in all districts east of the Rocky Mountains have been revised. By the proclamation of Jan. 31, manufacturers and distributers whose gross sales aggregated more than 100,000 barrels a year were required to obtain licenses from the Fuel Administration. The present revisions govern these licenses.

It was found that under the old rules distributers controlling only a small supply were unable to meet the requirements of all their customers, while those of large distributers were able to meet the needs of all consumers on the priority list. The new scheme provides that the Fuel Administrator may require a distributer to meet the demands of another distributer's customers before he can supply the needs of his own customers not on the preferred list.

The priority list follows:

1. Railroads, bunker fuel and oil refineries using or making fuel oil.
2. Export deliveries or shipments for the United States army and navy.
3. Export shipments for the navies and other war purposes of the Allies.
4. Hospitals where oil is now being used as fuel.
5. Public utilities and domestic consumers now using fuel oil, including gas oil.
6. Shipyards engaged in Government work.
7. Navy yards.
8. Arsenals.
9. Plants engaged in manufacturing, production and storage of food products
10. Army and navy cantonments where oil is now being used as fuel.
11. Industrial consumers engaged in the manufacture of munitions and other articles under Government orders.
12. All other classes.

Takes Over Cell-Beam Sales

NEW YORK, March 27—The Cell-Beam Corp., 501 Fifth Avenue, has been formed to take over the merchandising of the Cell-Beam spotlight formerly manufactured and sold by the Cell-Beam Mfg. Co., Brooklyn, N. Y. The incorporators are: President, Rex W. Wadman; vice-president, Nicholas G. Rost; secretary, J. J. Record.

Urge Motor Trucks for Rural Mail Service

John Blakeslee, Fourth Assistant Postmaster General, Outlines Plans by Which Service and Transportation Facilities Can Be Greatly Improved

WASHINGTON, March 25—The great opportunity for increased use of motor trucks in the rural mail service of all sections of the country was outlined today by John R. Blakeslee, fourth assistant postmaster general, in charge of rural mail delivery. Mr. Blakeslee says there is a 10 per cent reduction in the productivity of the manpower in the vicinity of Washington due to transportation difficulties.

Next winter we will be 10 per cent short of men, and this must be compensated for in some way. An increase in the service offered by rural mail delivery is considered one of the great possibilities.

There are 44,000 rural mail routes in the country and these average but eight pieces per route per day, which is less than 10 lbs. On the return trip the average is less than one piece per route per day. The entire average is less than 1 lb. per day per farm. Mr. Blakeslee sees no reason why, by means of the rural delivery system, the capacity of the farmer should not be increased. Through these channels the produce of the farm can be transported quickly to the place where it is required, and the merchandise from the city can be transported to the farmer, without the farmer's having to go to the market for it. These 44.000 delivery routes offer flexible channels for such work.

No Thought of Efficiency

At present too many of these rural mail routes are laid out without any thought of efficiency. They literally start from nowhere and end nowhere. A rearrangement is necessary so that at one end of the route there will be the town or city market requiring produce which can be brought in by parcel post delivery, and at the other end the productive country areas which can furnish the food supplies for the cities.

To this end, Mr. Blakeslee has been working on experimental rural mail routes which are not circuits but rather out and return routes over the same distance, this plan being adapted to increase trade for a parcels post service both ways.

An example of such a route, and the resulting business over it, is from Lancaster, Pa., to Gettysburg, to Baltimore, Md., a total distance of 105 miles. On the first day, only 56 lbs. of food produce from the farms was collected for the city markets, but after the route had been running 17 days the daily load had increased to 2200 lbs. Soon two motor trucks were necessary to serve it. Before this experiment was tried there was no thought of any necessity for a motor route over this area, as Lancaster possesses ample agricultural facilities to supply its needs. The same is true of Gettysburg and Baltimore. In spite of apparently unfavorable conditions the route has proven very successful, and in addition to parcels post matter, first class mails are carried.

An example of the thoughtlessness in laying out these rural mail routes is evidenced by the fact that from fifty-two of the largest cities in the country there are only 256 important rural routes leading out of these cities, and these rarely lead into the country areas but generally circle through the suburbs. Of these 256, 172 lead out of St. Louis. No rural routes leading into productive farm areas radiate from New York or Philadelphia, although it is from such centers that routes should radiate to make the food supply from the country to these cities more flexible.

Surveys Made

Surveys of rural routes out of such cities as Chicago, Denver, St. Paul, Detroit and Grand Rapids have been made, with the thought of establishing 100-mile routes from these cities into the country and back over the same roads. An example of how such a route works out is Savannah, Ga., where there is a route to Statesboro, a distance of 50 miles. Savannah is the center of a desert so far as food production is concerned, and it is not before you are 25 miles out of the city that you reach the productive area. It is possible with this 50-mile route to tap this productive area and bring farm produce to the city.

Examinations of parcels post shipment have disclosed the fact that much farm produce is taking an indirect road to the market, whereas with the rural motor parcels post system it would go direct.

Examples of Inefficiency

Here is an example: On a parcels post route out of Philadelphia is located the small town of Oxford, which is a great mushroom center, from which 1700 lb. per day are shipped by motor truck to Philadelphia, where they are re-shipped by the postoffice mail system to New York City, Lansdale, N. J., Washington, Baltimore, and other places. If these were transported direct from Oxford to Lansdale by motor it would be a 35-mile trip, whereas the way they are handled at present the distance is 177 miles.

Another example of how the motor rural delivery system could care for this farm-city transportation is the postoffice of New Holland, Pa., which ships 25.000 crates of eggs a week. Many reach New York by an indirect way through the railroad postoffice. This means many handlings. It is possible to send eggs direct from New Holland to New York and deliver them direct to the customer. There is no reason why such delivery direct to the customer should not be made by parcels post or fourth-class mails because it is done with the first-class mails. Sending these eggs through the regular postoffice channels requires twelve handlings where one should suffice.

Shipping 30 crates of eggs from Vineland, N. J., to New York now requires fourteen handlings. The cost of the eggs is doubled by the cost of the operations in transit. The time consumed between the farmer and consumer is more than doubled, and yet the distance is less than 100 miles. If motor trucks in the parcels post organization traveled between Vineland and New York, the operations of handling the eggs would decrease to two. The time for shipment from Vineland to New York would be slight. One motor truck could haul fifty crates of eggs direct from Vineland to New York in a day. At present the weight limit of any parcels post package is 70 lb. This permits shipment of a bushel of potatoes, which weighs 62 lb. or a crate of eggs, which weighs 52 lbs.

At present there are 8 different rural routes operating on this system. Some of them have one and others two trucks. They operate so as to cover the route each way once a day. If the route is short one truck makes a return trip. If it is too long for this, two trucks are used, one starting from each end of the route each day. The routes are as follows:

Route 1—Philadelphia to Atlantic City, 107 miles. A truck leaves each end each day. They meet at Vineland, midway.

Route 2—Baltimore to Solomons, Md., 92 miles. A truck leaves each end daily, but the one leaving from Solomons waits until the one from Baltimore has arrived.

Route 3—Washington, D. C., to Leonardstown, Md., 55.7 miles. Two trucks make the round trip each day, starting from opposite ends.

Route 4—Washington to Baltimore, 76 miles. The two trucks start from opposite ends and meet at Mt. Airy, where they turn, and exchange loads as necessary.

Route 5—Lancaster to Baltimore, 105 miles. Two trucks, one from each end, meet at Gettysburg, where they exchange loads and return over their respective routes.

Route 6—Baltimore to Philadelphia, 116 miles via Oxford. A truck leaves each end. They meet at Oxford, where they return over their routes. Oxford has a population of 2,390.

Route 7—Savannah, Ga., to Statesboro, Ga., 55.5 miles. One truck makes the trip out one day and back the next.

Route 8—Columbus, O., to Zanesville, O., 55 miles. One truck makes the round trip daily.

The capacities of the trucks used on these eight routes approximate 1½ tons. Most of them have pneumatic tires, 36 x 6 in. There is one man on a truck who looks after the mail, as well as the parcels post. Regular parcels post rates are charged and the driver can collect packages from one point and deliver them to another point on that route without the parcels having to go into a postoffice. He carries the necessary stamps and has the power to cancel them. In fact he transacts a regular postmaster business while on the truck.

The first of these routes with the exception of two Maryland routes which were already in operation, was started in December, 1917.

American Cars Popular in Southern France

Excellent Methods of Sale and Low Prices Made the Demand for United States Products Increase Rapidly Before the War

MARSEILLES, FRANCE, March 1—Prior to the war, the demand in the French Mediterranean region for American automobiles increased steadily and rapidly, due to excellent methods of sale and low prices, according to consular reports. It is believed that the demand will continue after the war.

There were approximately 8000 motor vehicles here, of which only a few hundred were trucks. The countries which sold cars in this region included the United States, Italy, Switzerland and England. A few German cars and certain French makes were also popular.

French roads are excellent, and cars are not subject to the same strain as are those in many parts of America. Therefore the cars that French manufacturers produced and sold here were not as strong as American cars, but were more economical, selling for an average of 8000 francs ($1,544) to 9000 francs ($1,737). In addition they conformed with the French tendency to have a small bore and long stroke.

The two types of cars that have had considerable success here are 5-7 and 12-16 hp. The details of these and of a popular truck follow:

Model ..... 5-7 hp	12-16 hp.	Truck 32.5
Capacity ..... 2-pass.	4-pass.	5-ton
Bore and stroke 2½x4¾	3x5	4¼x5
Speeds 3	4	..
Treaty gage... 49.275	49.212	..
Cylinders 2	4	4
Control.....right side	right side	right side
Body ..... Torpedo	Torpedo	..
Upholstery Buff lea.	Buff lea.	..
Wheelbase..... 123 in	130 in.	..
Price $917	$1,408	$3,281

To obtain satisfactory results, American companies desirous of entering this field should appoint a general agent at Paris with the power of appointing subagents throughout the provinces. The central depot should carry a full line of cars and trucks, as well as parts. The last item is especially important, as purchasers hesitate to buy a foreign car for which parts are not available.

A general agent in Paris is in a better position than the manufacturer to select efficient representatives in provincial centers. Furthermore, he is always in close touch with his subagents and can confer with them in regard to local requirements. He should also be able to organize a publicity campaign, which can be directed more easily from Paris, and he should take steps to participate in all shows, exhibitions and contests. In respect to obtaining orders from the French government an agent in Paris is of great value.

Cars Obtained on Consignment

Such agents usually obtain cars on consignment, paying a deposit on order, and the balance when the car is sold. They are sometimes required to guarantee a certain number of sales a year. Manufacturers give the agents a commission of 20 to 30 per cent of catalog prices, to cover expenses of advertising and commissions of subagents.

A guarantee of the car for at least a year is often required.

At present it is impossible to ship vehicles other than heavy trucks to France. Nevertheless it is advisable for American manufacturers to negotiate with agents, so as to be ready to enter the field when importation is permitted.

Trucks of 2 to 4 tons will be in the greatest demand after the war. Light delivery wagons will also grow in popularity. Chain drive seems to have the preference in this district, with the gear box located on the right side, and 3 or 4 speeds. Automatically regulated air admission to carbureters is usually required, due to severe climatic conditions. Lighting should be electric and the trucks should be equipped with plain or grooved band tires and towing hooks for trailers.

Each automobile of foreign make, before it can be placed in general use, must be accepted by the "Service des Mines" at which time it receives a registration number. Before a car can be accepted, a demand must be made on stamped paper, accompanied by specifications of the car, in French.

—

Cook Elected President of Lane Truck

KALAMAZOO, MICH., March 25—M. H. Lane has resigned as president and general manager of the Lane Motor Truck Co., and is succeeded by W. A. Cook, formerly with the Indiana Truck Co., Marion, Ind., who will also be chief engineer. W. W. Lang of Kalamazoo is vice-president, and L. W. Hamilton is secretary, treasurer and general manager.

The capital stock of the company has been increased from $25,000 to $250,000. The output for 1918 is proceeding on a basis of 600 trucks of 1½, 2½ and 3½-ton capacity. During 1917 the company built and sold 107 trucks.

—

3000 Cars Coming from Pan-American

DECATUR, ILL., March 25—The Pan-American Motors Corp. has announced that it will turn out 3000 cars during 1918.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Iron and Steel Prices To Continue 3 Months

The President announced on Tuesday that the agreed prices on iron and steel products would be continued for three months beyond March 31, except that basic pig iron and heavy melting steel scrap would be reduced $1 in April. This means, as foreshadowed in this review last week, a maximum price of $32 at furnace for basic iron, $35.20 for Bessemer iron, or a reduction of $1.10 a ton, and $29 instead of $30 for heavy melting scrap.

It was argued by the Government representatives that the high costs of January and February were due to an unparalleled combination of misfortunes, and should not be thought of as a basis for price advances. The board answered the strenuous plea of certain plate mills for an advance above 3.25c. for their product by the $1 reduction in basic iron and scrap, their main raw materials.

Scant consideration was given to the request of the steel manufacturers that in the interest of the whole trade, including consumers, the prices fixed be given a life of six months or more. The War Industries Board frankly favors lower prices, and it is understood that only the wretched showings of January and February saved the schedule from general reduction at this time.

The old-material trade, which has been in a turbulent state since Government control began, is further upset by the reduction so easily put through at last week's conference, in which scrap dealers were unrepresented. The proposal so long and strongly urged that buyers of scrap be allowed to pay dealers 3½ per cent commission seems to have been jostled aside by the main issues.

The Washington meeting only added to the quietness that has been noted in the market throughout the month. The uncertainty as to the amount of steel war demands will leave for general consumption has changed into uncertainty as to the amount of ordinary business that will remain to make demands upon the steel mills.

Fabricating firms are surprised almost weekly by calls for estimates on some Government building of unusual size. There is apparently no end to the number of enormous warehouses going up.

The effort of the Shipping Board to get ships from the manganese ore trade with Brazil is a matter of concern to the entire steel industry. The development of supplies proceeds slowly.—*Iron Age.*

A New Service

¶ Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

Fuel Zoning Plan and Prices Finally Announced

The long-awaited zoning plan has at last been announced by the Fuel Administration, as have also new price rulings in a few producing districts. The country has been divided into a number of producing zones within which consumption will largely be confined. In this way thousands of miles of long cross-hauls will be eliminated, thus making for an increase in car utility. A reduction in anthracite shipments to the West and Northwest has also been announced by the Fuel Administration.

Transportation facilities are still bad, the sidings in and around many collieries being congested with loaded coal cars. Considering the urgent need existing for coal, the situation cannot but be viewed with alarm. Bituminous has suffered a tremendous falling off in production, many mines being compelled to shut down because of insufficient empty cars to load. During March there was little improvement. If this condition is not remedied soon it will be exceedingly difficult for the operators to preserve intact their working organizations.

The heavy requirements for steam coal preclude any let-up in the demand. Shippers have not been in position to guarantee plenty of coal, and buyers have been ready to purchase every ton available. Here and there coal is still being confiscated by the fuel authorities for the use of public utilities which do not seem able to get an adequate supply from their regular sources. Retail dealers report many orders.—*Coal Age.*

Ford Tractor Production Plan Unchanged in Growth

(*Continued from page* 624)

A small section of the machineshop is given over to the magneto department. Here some of the sub-assemblies of the magneto are made preparatory to the general assembly processes. Another part of the machineshop is taken up by the tool room, which extends along the inside wall.

Parts leaving the machineshop pass to the assembly shop, where the transmission units are put together in one part and the engine units in another, the two coming together at the final assembly nearest the shipping platform. This assembly work will eventually be done on a sort of carrier or belt system, the same as in use in large motor car factories. At the present time the carriers used are simply wheel trays which run on rollers inside of the two channel beams which are arranged parallel to each other in the form of a track. Thus the production travels a sort of semi-circular path, starting at the foundry and stockroom, passing around through the machineshop and out the assembly shop to the loading platform, or dock.

There are a number of miscellaneous departments which have been placed in close proximity to the other plants, and these are also indicated on the map herewith. For instance, the heat treating room is next to the productive stockroom. The heat treating furnaces and carbonizing furnaces are arranged along opposite walls, allowing the work to be fed into them from the center. The same method is used in connection with the babbitting and blacksmith shop, which are on the side wall, allowing the material to be fed from the open space in the center of the room. A special room is used for magneto heat treating.

The pattern shop is at present located adjacent to the assembly shop, but will probably be changed shortly. Both metal and wood patterns are taken care of in the one department.

A new section is being added to the power house. A large gas producer has been installed, and the wheels are being put up around the producer, which is already in position. This will complete the power house to an extent necessary to take care of the growing production. The accompanying illustrations tell the story of the building work which is going on and give an idea of the remarkable manner in which plant increases and production increases are being made at the same time. Urgent orders are being filled, a shipment of twenty-five a day being required, starting April 1, to fill the order for 1000 which the Michigan State authorities recently gave the Ford company, and twenty-five a day are to be turned over to Canada to fill an order by the Canadian government. Another large commonwealth is reported to be negotiating at the present time to place a large order for these tractors with the company.

Men of the Industry

Changes in Personnel and Position

Kepperly Succeeds Morgan as Curtiss Vice-President

DETROIT, March 22—James E. Kepperly has been appointed general manager of the Curtiss Aeroplane & Motor Corp., Buffalo, succeeding William A. Morgan. Kepperly has also been elected vice-president, a member of the executive committee and a voting trustee. He has been associated with Willys interests for some time, and is vice-president and counsel of Willys-Overland, Inc.

—

A. B. Walton, formerly sales manager of the Master Carburetor Co., Los Angeles, has received the commission of captain in the ordnance department.

—

W. J. Carr, for 2 years purchasing agent of the Falls Machine Co., Sheboygan Falls, Wis., has become associated with the purchasing department of the Aluminum Castings Co., Cleveland.

—

W. O. Rutherford, sales manager of the B. F. Goodrich Co., Akron, has been elected vice-president of the company.

—

Edward Hutchins, formerly supervising engineer of the Federal Rubber Co., has been elected vice-president of the Gillette Rubber Co., Eau Claire, Wis.

—

W. T. Edwards, formerly with the battery division of the Intermountain Electric Co. of Utah, has been elected president and general manager of the Edwards-Warden Motor Parts Co., Salt Lake City.

—

Gould Allen has resigned his position as sales manager of Fuller & Sons, Kalamazoo, Mich., and has been appointed manager of the Detroit office of the Wetzel-Hall Co.

—

L. A. Closter has been appointed district manager of the Federal Motor Truck Co., Detroit, for Michigan, Indiana, Ohio, Kentucky, West Virginia and western Pennsylvania. He was formerly associated with the Centaur Motors, Inc.

—

Gustavus Sickles has been appointed sales manager of the Sullivan Motor Truck Corp., Rochester, N. Y.

—

Ernest T. Conlon has become district factory representative of the Reo Motor Car Co., Lansing, in the Southwest after 3½ years as executive secretary of the Automobile Business Assn. of Grand Rapids.

Harry F. Prescott has been appointed sales manager of the Disco Electric Mfg. Co., Detroit. He was formerly connected with the sales department of the Saxon Motor Car Co.

—

Donald W. Douglas, formerly aeronautical engineer in the aviation section of the Signal Corps, has been appointed chief engineer of the Glen L. Martin Co., Cleveland.

—

Raymond V. Morris has been appointed general manager of the Savage Tire Co. and the Savage Tire Corp., San Diego, Cal., and will have complete charge of all the activities of the Savage companies. He was formerly connected with the Curtiss Aeroplane & Motor Corp.

—

O. S. Comer has been promoted to the position of assistant to the foreign sales manager of the J. I. Case T. M. Co., Racine.

—

W. E. Perrine, production manager of the Standard Parts Co., Cleveland, has been promoted to the position of assistant general manager and chairman of the executive board. He will carry on the work of Christian Girl.

—

W. A. Cluff, who for some time has been auditor of the Mason Tire & Rubber Co., has been elected to the board of directors. He has also been appointed first assistant treasurer.

—

C. J. E. Leach has been promoted to the position of manager of the New York State branch of the Massey-Harris Harvester Co., Batavia, N. Y. He was formerly manager of the Kansas City branch.

—

Clifford A. Williams has been appointed director of sales of the Kissel Motor Car Co., Hartford, Wis. He has directed several merchandising campaigns.

—

O. L. Blanchard has been appointed district manager of the Fruehauf Trailer Co., Detroit, and will have charge of sales in the eastern, southern and middle-western states.

—

Wayne Murray has been appointed general manager of the L. J. Robinson Co., Detroit, Michigan distributer for Maxwell and Chalmers cars. He was formerly Nash distributer in Chicago.

—

General Tire & Rubber Changes

AKRON, OHIO, March 18—The General Tire & Rubber Co. has made several changes in its sales organization. H. E. Taylor has been shifted from the position of representative in Indiana and Illinois to that of Chicago district manager. C. H. Bemis will succeed him in Indiana, and Howard F. Smith has been appointed special representative.

New Companies Formed

Latest additions to ranks of Automotive Industries

Make Trucks and Tractors Under Bollstrom Patents

DETROIT, March 23—The Bollstrom Motors Co. has been organized with authorized capital of $3,000,000 to manufacture trucks and field tractors under the Bollstrom patents. The company has bought 55 acres and leased another 100 acres in Marion, Ind., and will erect a plant immediately. Guy Hamilton has been appointed general manager.

—

To Make "Farm Boy" Tractor

COLUMBUS, OHIO, March 23—Plans have been completed for the organization of a $1,000,000 tractor company to manufacture the "Farm Boy." This tractor is at present being made by the McIntyre Mfg. Co., which organization will be absorbed by the new company. The present capacity will be doubled immediately, and the output, which has been entirely contracted for by France, will be increased.

—

To Make Boring Tractor

ROCKFORD, ILL., March 23—The Boring Tractor Corp. has been organized here to make a new type of farm tractor invented by Charles E. Boring. This will be a 2-wheel model and carry the plow between the drive wheels. The incorporators are J. F. Carpenter, C. B. Williamson, C. E. Boring and F. C. Ricard.

—

Trucks Coming from Salt Lake City

SALT LAKE CITY, March 23—The Wilson Motor Co. has been incorporated to manufacture Wilco trucks, and has bought the building and machinery of the Dickinson Automatic Governor Co. Production has already been started, and the first delivery will be made about April 15. It is planned to turn out 25 one-ton trucks a month. George S. Wilson has been elected president, H. C. Sillett treasurer and W. Daniels secretary.

—

Makes Gasoline from Gas

SALT LAKE CITY, March 23—The Hope Engineering Co. has started work on extracting gasoline from gas. The company has gas wells with an output of 15,000,000 cu. ft. a day, and the capacity of the plant is at present 6,000,000 cu. ft. a day. One and a half gallons of gasoline is made from every 1000 cu. ft. of gas. The initial cost of the Hope Engineering plant was $500,000. Additional wells have been purchased, and these will be used later.

Digitized by Google

Durant Sells Interest in California Chevrolet

OAKLAND, CAL., March 25—W. C. Durant has disposed of his interest in the Chevrolet Motor Car Co. of California. The deal involves, it is claimed, about $1,000,000, and places the control of the plant in the hands of Norman De Vaux, president of the company, and R. C. Durant, son of W. C. Durant, who has been general manager of the company for the last year. The capital of the Chevrolet Motor Car Co. of California has been increased to $1,500,000, all paid in, and production will be increased.

—

Spranger Wire Wheel in New Plant

DETROIT, March 25—The Spranger Wire Wheel Co. is now in production in its new factory. The building is on a 5-acre tract of land and is 250 x 160. The company's production is 125 sets of wheels a day, of which 75 per cent is for the Government. Two new types of wire wheels are being tested, and it is expected that production of one of them will start in June.

—

New Plant for Hackett Motor

JACKSON, MICH., March 25—The Hackett Motor Car Co. has started work on the first unit of its Burlingame plant. It is planned to have this ready within 60 days, and to double the present capacity within 6 months. The new plant will be used for assembling, body-building, painting and upholstering.

—

Central Rubber Moves to Defiance

AKRON, OHIO, March 22—The Central Rubber Co. has purchased the building formerly owned by the Diamond Glass Co., Defiance, Ohio, and is preparing to move its plant to this city. The company will employ about 150 men.

—

Factory for Landers Bros. Co.

TOLEDO, March 25—A factory is being erected by the Landers Bros. Co., where fabrics will be coated and rubberized for automobile tops and side curtains. Fifty men will be employed. R. E. Landers is president of the company.

—

Overland Drive-aways Break Records

TOLEDO, March 25—Recent drive-aways at the Willys-Overland plant have broken all previous records. Last month 2938 cars were driven across country.

—

Niles Car Plant Sold

NILES, OHIO, March 20—The Niles Car & Mfg. Co. has sold its truck factory to the Niles Motor Truck Co. of Pittsburgh.

—

Reo Drive-aways Increase

LANSING, MICH., March 26—Drive-aways from the Reo Motor Car Co. are steadily increasing. Three weeks ago 8 per cent of the production was driven away; 2 weeks ago the percentage increased to 18, and last week it was 28 per cent. A few days ago 26 speed wagons (¾-ton trucks) left for Atlanta, Ga., and a train of 10 speed wagons and passenger cars went to Charleston, S. C.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

—

Leonard Tractor Co. in Canada

JACKSON, MICH., March 23—The Leonard Tractor Co. of Canada, Ltd., has been organized as a subsidiary of the Leonard Tractor Co. of this city. The Canadian company will build 2500 tractors during 1918, according to H. M. Leonard, president of both organizations. The exact location of the plant has not been decided on yet.

—

Increases of Capital

AKRON, OHIO, March 23—The Mohawk Rubber Co. has increased its capital from $1,050,000 to $2,050,000.

—

DETROIT, March 23—The Fruehauf Trailer Co. has increased its capital from $100 000 to $150.000. The production of trailers has been doubled during the last 2 months, the present output being 35 a week.

—

MILWAUKEE, March 25—The Industrial Controller Co., manufacturer of electric controlling devices, has increased its capital stock from $100,000 to $150 000. A shop addition was recently completed and placed in service.

—

Dividends Declared

The Locomobile Co. of America has declared a regular quarterly dividend of 1¾ per cent on preferred stock, payable April 1 to stock of record March 20.

—

The Hupp Motor Car Corp. has declared a regular quarterly dividend of 1¾ per cent on the preferred stock, payable April 1 to stock of record March 20.

—

The Mason Tire & Rubber Co. has declared a regular quarterly dividend of 1¾ per cent on preferred stock, payable April 1 to stock of record March 20.

—

The Hendee Mfg. Co. has declared a dividend of 1¾ per cent on preferred stock, payable April 1 to stock of record March 20.

—

The General Motors Corp. has declared a regular quarterly dividend of 3 per cent on common and 1¼ per cent on preferred stock, payable May 1 to stockholders of record April 15.

—

The Chevrolet Motor Co. has declared the regular quarterly dividend of 3 per cent on common stock, payable May 1 to stock of record April 15.

Nelson Truck Co. Buys Saginaw Motor Plant

SAGINAW, MICH., March 25—The newly organized Nelson Bros. Truck Co., which has a capitalization of $300,000, more than half of which has been paid in, and which is to manufacture the Jumbo 2½-ton truck, has purchased the plant of the Saginaw Motor Car Co. According to schedule, production of one truck a day will be under way within a few weeks, and will be increased as rapidly as necessary additional mechanical equipment can be installed and skilled labor obtained. The company plans to erect a permanent factory as soon as building prices drop to a lower plane.

The officers of the company are: President, Harry B. Nelson; vice-president, Clarence A. Nelson; secretary and treasurer, Clinton J. Nelson.

—

New Company Buys Rush Motors

PHILADELPHIA, March 25—The Rush Motors Corp. has been formed and has taken over the stock of the Rush Motor Truck Co., which it purchased at the receiver's sale. The new company has obtained the building formerly occupied by the Bourne Magnetic Truck Co. and will continue the production of Rush trucks as well as service for those now in operation.

—

Yale Eight Discontinued

SAGINAW, March 25—The Saginaw Motor Car Co. has discontinued the manufacture of the Yale Eight and has sold its entire plant to the Nelson Bros. Truck Co., Saginaw. The Puritan Machine Co. of Detroit has purchased the service stock of the company.

—

Reo 4-Cylinder in Production

LANSING, MICH., March 20—The Reo Motor Car Co. has started production on its new 4-cylinder model. Within 3 weeks the company expects to be making 75 daily. Driveaways during the past week have been reduced 50 per cent, due to heavy rains.

—

Gasoline Stolen from France

PARIS, March 1—To be able to steal 30,000 gal. of gasoline in a country where every drop is rigorously controlled, and where the utmost restrictions prevail, indicates a wonderful amount of ingenuity on the part of the thief. The person who has been able to elude the scrutiny of the inspectors and at the same time rob the State and her employers is a woman employed by the Deutsch Co. in Paris. This woman, whose duty it was to control the vouchers issued by the police for the delivery of gasoline to authorized persons, found some means of retaining these vouchers, instead of handing them back to the police headquarters, and later of delivering them to gasoline retailers. In this way the voucher was made use of twice. The retailers got delivery of gasoline on these stolen vouchers and sold this

Digitized by Google

fuel to private individuals not provided with a permit to purchase. It was a profitable investment, for instead of selling at $9, these retailers sold at $15. After a discrepancy in the accounts to the extent of several thousands of gallons, an inquiry was made and the woman primarily responsible was arrested, together with several of the retailers who had made use of the stolen vouchers.

Promote Brake Inspection Idea

TRENTON, N. J., March 25—The Thermoid Rubber Co. is promoting a brake inspection campaign throughout the United States with the object of inducing car owners to inspect their brakes, and if they are not up to par have them relined. Endorsement of the idea has been obtained from various authorities and the idea is being promoted in the company's advertising.

Ford's Milwaukee Men Find Work

MILWAUKEE, March 25—More than one-half of the entire working force of the Milwaukee plant of the Ford Motor Co. already has obtained employment elsewhere, and by April 1 only the accounting and service force will be left intact. The plant will be closed until Aug. 1 or later, as a result of the 40 per cent reduction in Ford output. Many of the men have obtained employment in the plant of the A. O. Smith Co., Milwaukee, maker of pressed steel frames, parts, etc., and others have been placed with Ford plants in other cities.

New Ohio Drive-Away Route

TOLEDO, March 25—A new route through Ohio for drive-aways has been announced by the Lincoln Highway Assn. It is via Toledo, Fostoria, Bucyrus, Mansfield, Olivburg, Ashland, Canton, East Liverpool and Beaver, Pa., to Pittsburgh. The route out of Detroit via Lima, Springfield, Columbus, Ohio, and Pittsburgh, following part of the national Old Trails road, has been rendered impassable by the collapse of the Ypsilanti bridge.

Government Contract for Workmen's Homes

KALAMAZOO, MICH., March 27—The United States government has awarded a $2,000,000 contract to the O. W. Rosenthal Co. for the erection of housing facilities in the River Rouge district where Henry Ford's shipbuilding plant is located. Homes for about 6000 workmen will be erected, and it is planned to have them ready about June 1.

"Car in Transit" Sign Not Accepted

DETROIT, March 26—Sixty Oldsmobiles being driven overland via the Lincoln Highway were held up at York, Pa., for not having license tags. The "Car in Transit" signs the cars bore were not accepted. The New York distributer to whom these cars were consigned met an additional expense of $720 for the complete set of license plates, fines, salaries and expenses of the men while idle.

War Board Restricts Imports

List of 82 Products Includes Cars, Asbestos, Graphite, Acids, Nickel and Zinc

WASHINGTON, March 22—The War Trade Board, through its Bureau of Imports, has published the first list of restricted imports, containing some 82 products, most of which are but remotely connected with the automobile industry. Among those more closely allied with the automobile industry are asbestos, cars, carriages and other vehicles, plumbago or graphite, all acids, nickel and zinc.

Hereafter licenses to import these products will not be granted except (1) when they have actually been shipped prior to April 15, 1918; (2) when coming by rail from Mexico or Canada, or (3) when coming as a return cargo from a convenient port and where their exportation is not specifically prohibited by American Allies.

The list has been issued under the Trading with the Enemy Act, by the terms of which the President on Feb. 14 issued a proclamation which required licenses for all exports and imports. The purpose of the measure is to conserve shipping space, and it is estimated that approximately 1,500,000 tons of cargo space will be saved in the 7½ months' period ending October, 1918.

At present there is a good supply of asbestos on hand, this being used chiefly for insulating purposes in steam installations. Probably between 80 and 90 per cent of the asbestos imported comes from Canada, and but a very small percentage of this is used directly in the automobile field. There is sufficient graphite on hand to last 6 months. About 10 per cent is used for lubricants and from 65 to 75 per cent for crucibles. Only the larger automobile manufacturers use these crucibles, and it is stated that they will not feel the restriction. Most of the graphite comes from Ceylon and Madagascar. The graphite people are sanguine that when licenses for imports are necessary they will be forthcoming.

The list which has been issued is essentially a list of non-essentials in that it includes only those products of which the United States already has an adequate supply to last a long time or which are now being produced here in sufficient quantity to take care of our needs.

Industrial Development in Canada

DETROIT, March 25—Figures compiled by the Ontario Motor Car Co., Ltd., Toronto, Ont., and published by the Packard Motor Car Co., show the industrial development of Canada in every line. Savings on deposit with Canadian chartered banks totalled $985,790,000 in 1917, an increase of 20 per cent over 1916. Bank clearings increased 15 per cent. Canada's production has also increased, the value of the crops being $1,089,000,000 in 1917 as compared with $886,494,000 in 1916 and $638,580,000 in 1914. Numerous munitions and ordnance plants were built and equipped last year, including the British Forgings and Aeroplanes, Ltd. The number of automobiles in Canada has increased proportionately, being 116,557 in 1916 and 191,518 in 1917.

Business Improves in Southeast

DETROIT, March 26—Manufacturers report good business in the southeast. Sales likewise are growing in the Middle West, New England and New York.

Cadillac is shipping limousines only to Ohio, Indiana, Michigan, and parts of Illinois. The cars are driven to Chicago and loaded there for shipments to western points. There is a great demand for cars in Canada, the Saxon company finds; orders for 5 carloads having been received from Toronto alone. Due to the heavy snows, Canada could not obtain cars, and is now feeling the shortage.

Ninety per cent of the cars made by the Paige-Detroit company are being driven away. Some have gone as far as Fargo, N. D., and Denver.

"2½-Cent Motor Fuel" Costs More than Gasoline

NEW YORK, March 22—The claim of Dr. Louis Clement, a Scandinavian experimenter, that he could produce a motor fuel costing from 2½ to 8 cents a gallon, was disproved recently at a test conducted before a group of chemists. According to reports, Dr. Clement used about 5 lbs. of naphtha flakes, half a gallon of benzine, several ounces of saccharine, some bicarbonate of soda, potassium chlorate, a small bag of alum, 3 gal. of wood alcohol, several ounces of oil of cedar, one ounce of sulphuric acid, 2 bags of talcum powder and about 15 quarts of kerosene. Produced with these ingredients, the chemists estimate that the motor fuel would cost more than 40 cents a gallon.

New Used Car Report Out

CHICAGO, March 27—The Used Car Report put out by the Chicago Automobile Trade Assn. has been issued in its sixteenth edition in a new form. The contents are printed as a filler for a stiff board binder. When each of the quarterly reports is received, the user is requested to take out the old filler, send it back to Chicago, and insert his new filler. This provides a better cover, makes the book lighter in weight and facilitates the work in various other ways. Recently there have been added to the book the American Six, Brewster, Comet, Doble, Holmes, Jones, Maibohm and Pan-American.

Mid-Continent Crude Oil Now $2.25

TULSA, OKLA., March 25—The price of Oklahoma and Kansas crude oil has been increased 25 cents a barrel by the Sinclair Oil & Gas Co., making the present price $2.25, the highest ever posted for mid-continent crude oil. It is expected that other companies will also increase their price.

Digitized by Google

Employment of Women Making Rapid Headway

INDIANAPOLIS, March 26—The employment of women in factories has made considerable headway in Indianapolis within the last few months with firms that formerly employed few, if any, women in the manufacturing or inspection department of the factory.

Wheeler-Schebler has for some time been employing women in the Inspection Department and now has more than 50 women employees. Many of these are sisters and daughters of factory employees. In the departments the women are entirely separated from the men. Rest rooms have been fitted up, and a matron has supervision over all of the women employed.

Satisfactory chairs with suitable backs and foot rests are provided. In the Inspection Department the room has been painted white, which has had a psychological effect on the workers.

An effort is being made to have the girls take more substantial lunches than they have been in the habit of doing and coffee is furnished at 1 cent per cup.

Up to this time Wheeler-Schebler has not engaged women in any department where much physical effort is required. The percentage of women changing their positions is much less than that of men according to the experience of this firm.

—

Advertising a War Time Expense

LONDON, March 25—The British War Government recognizes advertising as a necessary expense even for firms almost entirely engaged in the manufacture of munitions. The British Ministry of Munitions recently stated in the *Manchester Guardian* that no arbitrary rule had been made in reference to the advertising expenses of these establishments which, as the Government expressed it, "are controlled." The statement follows:

"In dealing with such establishments for the purpose of munitions levy, it has been the practice of the Ministry to make full allowance for advertising on a pre-war basis; and while it is possible that cases may arise in connection with contracts with the Ministry in which advertising charges would have to be more or less disregarded owing to the particular contract basis, such charges are in general treated as part of the legitimate establishment charges of the firm. All such cases are dealt with separately on their merits."

—

$1,500,000 Surtax for Massachusetts Motorists

BOSTON, March 22—After a hearing before the Committee of Taxation, which lasted less than half an hour, a subcommittee was appointed to draft a bill for a surtax of $1,500,000 to be collected from Massachusetts motorists. State Senator Gifford, in introducing the measure, said flatly that this was the easiest way to get the money needed, as all passenger car owners are listed. The measure calls for a tax, in addition to present fees, of $5 for owners now paying a $15 fee; $10 for those paying more; $2.50 a ton for trucks; $2 for operators and drivers, and $5 for dealers' cars.

—

Monthly Labor Surveys for War Industries

WASHINGTON, March 23—The United States Public Service Reserve is making a month to month survey of the actual labor conditions in war industries to learn the full strength of American labor applied to war purposes. More than 500 plants now send monthly labor-status reports to the Reserve and it is expected that in the course of 60 days 2000 plants will make them. These reports act as a labor barometer, enabling the Department of Labor not only to prevent serious shortages, but also to meet promptly the new demands for labor which follow rapid expansion of production.

—

Truck Convoy For Overseas

LIMA, OHIO, March 25—The first convoy of U. S. A. standardized war trucks comprising thirty-three of the standardized trucks left Lima this afternoon en route for an eastern seaboard. This is the first convoy of the standardized trucks to travel overland bound for overseas duty and marks the beginning of huge production of the trucks. Complete sets of parts are now in hand in assembly plants for more than 500 of the class B standardized trucks.

Albert Guyot, Racer, Now Consulting Engineer

PARIS, Feb. 26—Albert Guyot, winner of third prize on a French Delage in the 1914 Indianapolis race, has been discharged from the army as the result of injuries received while on active service as an airplane pilot, and has entered into partnership with N. Causan, as a firm of consulting engineers. Engineer Causan has a reputation as designer of high-efficiency racing motors, having produced successful boat and car motors for Delage, Panhard-Levassor and Despujols. Recently Causan returned from America, where he had spent a couple of years, part of that time being with the Chalmers company. Causan and Guyot are particularly interested in racing and aviation motor developments. Their business address in Paris is 81 Rue Laugier.

—

Regulations for Exports to Sweden and Greece

WASHINGTON, March 25—The War Trade Board has issued new regulations for licensing shipments to Sweden and Greece. In the case of Sweden, a handelskommission, or import certificate, must be obtained from the Swedish Government before application for export can be made to the Bureau of Exports. In the case of both countries the application for export is sent to the War Trade Board's representative abroad, and as soon as a decision is reached as to the advisability of the shipment the applicant will be advised.

—

Survey of War Industries Locations

WASHINGTON, March 25—The War Industries Board is making an extensive survey for the location of war industries. This may result in the transfer of many government contracts from the congested Eastern industrial centers to the West and the South, where factories are working under less pressure, have less difficulty with labor and enjoy better transportation facilities. Many contracts will expire April 1, and it is likely that Eastern manufacturers will not secure renewals where the contract can be placed in the West or in the South.

Calendar

ASSOCIATIONS

April 15-19—Little Rock, Ark., United States Good Roads Assn. Sixth Annual Session.

June 5-12—Hot Springs, Va., National Assn. Automobile & Accessory Jobbers.

The New Case Six

Style Cars

DEALERS find that much is being said in appreciation of the grace and charm of the New Case Six. Even though this is not a time when men buy for style alone.

This points the way for wise dealers.

For a short time in the motor world it looked as though the whole consideration would be utility. And that in the zeal for economy, appearance would be secondary.

Case avoided this tendency. A utility car such as the Case can be beautiful as well. Economy and art may be related.

And so in the New Case Six, although it combines in its mechanical makeup all the proven features, is at the same time a car of striking and dignified appearance.

It has been rightly named "The All-Feature Car," because every part, every principle is known and appreciated as a feature found in the finest cars.

There are a number of places where an opportunity is open for dealers to handle the New Case Six, on a very profitable basis. Write to ascertain if this opportunity exists in your territory.

Heat Control

"HEAT TREATMENT"—annealing, case hardening and tempering—determines more than anything else the quality of the finished product.

"Heat Control"—the secret of heat treatment—is reduced to an exact science in our plant.

Your valve, bolts, and special parts are heat treated in furnaces whose temperatures are indicated by electrical pyrometers so sensitive that even a variation of less than five degrees is easily seen. An elaborate valve control system centralized at the pyrometer room enables these variations of temperature to be promptly corrected.

No element of chance enters into our heat treatment. The temperature is tested—controlled—KNOWN.

Cork Insert Brake Lining

gives a SURE brake ALL the time

3 Big Points of Superiority

1 Less pressure required on pedal

Cork Insert Brake Lining has by far the highest co-efficient of friction of any lining. It *takes hold* firmly at the slightest touch of the toe to the brake pedal. Less pressure means less heat, longer wear, more positive service.

2 Unaffected by oil or grease

Oil on ordinary lining, destroys its ability to *hold*. Makes it undependable and dangerous. Cork Insert Brake Lining is not affected by oil or grease. It is always *dependable*—always can be relied on to *take hold* instantly—positively.

3 No grab, slip or SQUEAK

Cork Insert Lining never glazes over or gets slippery—insures freedom from grabbing and slipping. Both corks and lining wear very slowly. It gives a longer service than any other lining and holds its high frictional qualities and original efficiency to the last mile.

DEALERS! Here's another big money maker for you. The success of Cork Insert Transmission Linings and Fan Belts for Fords is being repeated *in an even bigger way* in Cork Insert Brake Lining. It is handled by the same jobbers who handle the other Cork Insert products. Get this lining in stock for it is *going big*.

Super-Strong

Why must your motor develop power which never reaches the driving wheels?

At every bearing point transmission, differential and hubs—friction takes its toll. Power oozes out in the form of heat and wear—until the energy emerging at those husky driving rims is considerably reduced.

Only ball bearings reduce this internal friction to the lowest point. New Departures have the strength and stamina for the heaviest loads their capacities are known and fully guaranteed.

The most unusual reference book on ball bearings ever published is offered to designers and builders of automobiles, aeroplanes and tractors.

What's Going On, Now, Inside Your Car?

Inside the engine?—the gearcase?—the differential?—the transmission?—the bearings?

THESE are the vital places that make—or fail to make—your motor car a source of personal pleasure—your motor truck a source of personal profit.

These are the vital places—places which should be protected by scientific lubrication.

You can have *positive* protection for your car's valuable mechanism by insisting on scientific lubricants:

Motul, for your motor.

Gearese, for transmission gears.

Cupese, for bearings and every place lubricated through a grease cup.

Send for, "The Insides of Your Car"—a 36-page book which covers completely the subject of automobile lubrication, and which gives real money-saving facts that you may have overlooked; also for booklet "Once a Year Remember." Yours for the asking.

SPECIALTIES

GEARESE

—A correct lubricant for motor car transmissions and differentials.

It follows the gears continuously, leaving no spot where metal can touch metal. Gearese insures against wear, reduces friction and insures a silent, smooth-running car. Gearese maintains its lubricating consistency under all temperatures.

Gearese should be packed into your gear case and differential about once a year.

CUPESE

—A special quality cup grease, produced by the exclusive Acaloric Process. It is made in all densities, from very light to extra heavy. Ideal for wheel bearings, brake connections, gear and clutch levers, universals, spring leaves and bolts, steering arms and knuckles and axle caps.

Cupese spreads rapidly, adheres to the bearing surfaces, absolutely prevents metal-to-metal contact. It does not liquefy or evaporate under intense heat—does not cake at low temperature—does not clog bearings or leave residue in cups. It is *all* lubricant.

MOTUL

—A superior quality oil for the protection of automobile motors. Motul is made by a special process which insures super heat-resisting qualities. Although the heat of explosion in the cylinders is terrific, Motul maintains its lubricating consistency—keeps friction under control—protects your motor, bearings and cylinders. Under test Motul shows a minimum of carbon residue.

SLO-FLO

The super-lubricant; will not drip, climb nor spatter, withstands excessive heat and pressure.

AERUL

A practical high quality oil for aeroplane motors.

ASBESTESE

An asbestos and wool-mixed grease lubricant for car journals.

MARINUL

A well-known special oil, produced to meet the excessive stresses of marine service.

CORUL

A liquid binder that meets the 11 requirements of perfect core casting.

TEXTUL

An economical, high quality oil compound for wool and worsted manufactures.

TALESE

An economical, practical drop-forge die-swabbing grease compound.

EXESE

The 600 deg. F. Lubricant—for oven gears, bloom cars—calender rolls, automatic stokers—or lubrication under excessive heat conditions anywhere.

VESUVESE

A waterproof lubricant for exposed gears—for wire cable dressing.

LARCUL

A practical, economical metal-cutting lubricant.

Also, S-F general Grease and Oil Products.

Exceptional proposition open to auto accessory Jobbers and Dealers. Write for details. S-F Auto Div.

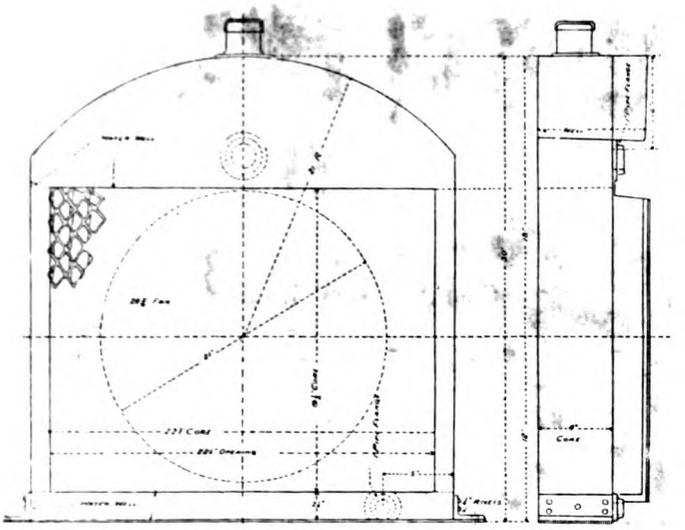
The SPERY

The most exacting requirement placed on any radiator is truck work—and at this the SPERY Radiator excels.

For manufacturers of motor trucks or tractors, for dealers in them and users of them there are practical reasons for the installation of SPERY Radiators that you cannot afford to overlook.

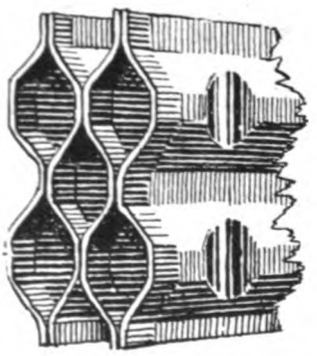
With service as your goal you must at least know SPERY points of superiority. They are points of economy and efficiency that will save and make money for you.



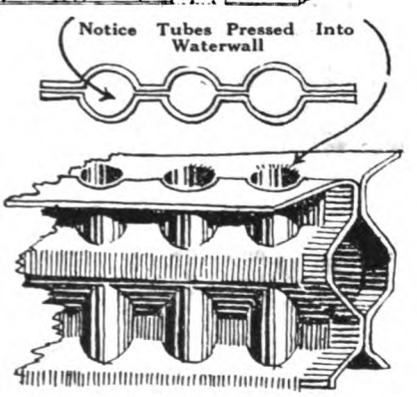
Digitized by Google

RADIATOR

The SPERY Radiator is a new and superior type for motor trucks and tractors—and here are the reasons why:



1—It combines every advantage of the tubular and honeycomb types without the disadvantages of either.
2—It has 30% to 40% greater cooling efficiency.
3—It is extremely light in weight.
4—It is the most rigid radiator made.
5—It is so durable it withstands the hardest service.
6—It offers the surest resistance against freezing.
7—It will not clog or leak.
8—It adds years to the life of the vehicle.
9—It is the handsomest, simplest and best core construction made.



Our offer to motor vehicle manufacturers is unusual and advantageous. We will even send on request a sample radiator for tests by your engineers.

And there is **a liberal dealer offer** for selling the SPERY for replacements.

MARMON 34

Advanced Engineering

First to Sail Uncharted Seas

In the development of the modern motor car, each new voyage of discovery has had its venturesome pilot. It has ever been the courage of a few that has led the many to success

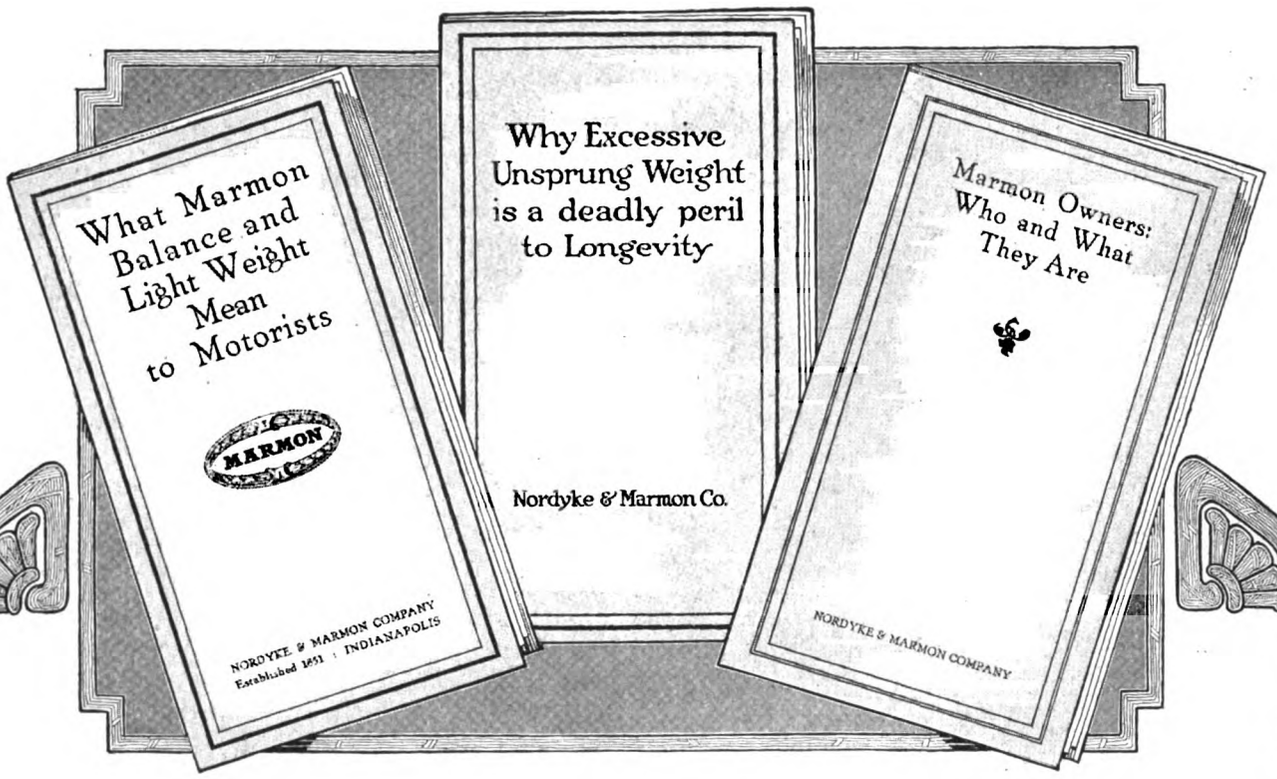
BUT no exploration in the history of the industry ever called for more gallant enterprise than that on which the Marmon engineers set out four years ago. Behind them lay all the experience and development in motor cars up to the outbreak of the European War. Before them lay the unknown seas of engineering.

For more than two years they searched this trackless main, sounding new depths and discovering many new ideas and mechanical principles. To mention a few: They found how to lessen weight of the car a full half ton and yet improve its roadability and riding ease:

—how to produce a short turning radius and yet retain the desired long wheel base:

—how to design seats wide and deep and yet build a body exceptionally low:

—how to attain almost perfect balance and eliminate numerous secondary parts:



They charted the way to great efficiency and power over a course of small fuel and tire consumption.

In ways like these through the Marmon 34 the world has received the accepted guide to scientific construction. And the public has, in recognition, awarded this car the place of preferment.

Sales Follow this Established Leadership

THE Marmon sales proposition is exceptionally attractive to dealers in many ways. One sale equals two or three sales of low priced cars. And due to Marmon's leadership in the high grade field, it adds unquestioned prestige to the dealer who represents it.

Please do not entertain the mistaken idea that Marmon sales are confined to the large cities. They are not.

Many are sold in the metropolitan centers, it is true—but small town dealers have also made phenomenal records because of this car's wonderful adaptability to country driving.

The Marmon handles so easily, holds the road so well, and operates with such economy on any road or trail that it finds a ready market in any territory.

These points are better understood by those who know the principles of Marmon construction—the light weight, the balance and other vital advancements, which are explained in these interesting booklets illustrated here.

These booklets constitute just one of the many forms of effective sales assistance that are being constantly furnished to Marmon dealers.

Where Your Money Goes

WE are now building more naval and merchant ships than we have constructed in the last generation.

We are building a vast fleet of airplanes, and enormous supplies of artillery, motor trucks, machine guns, rifles and ammunition. We are feeding, clothing and training an army of a million men, and preparing for a million more. We have loaned billions of dollars to our allies to be spent in the United States.

From the shipyards of the Pacific to those of the Atlantic; on our farms and in our mines, mills and factories in every state in the Union; back of the firing lines in France, where men are training, camps are being erected and railroads built, billions upon billions are being expended for labor, for transportation, for materials and supplies of every description.

The mind can hardly conceive the sums of money required for our war preparations. Yet these expenditures are absolutely essential. We must win the war quickly if possible; we must carry it on for years if necessary. We must do the job with American thoroughness, let the cost be what it may.

Remember, when you invest in your Liberty Bonds, that there is immediate, urgent, imperative need for every dollar you can possibly spare.

An official photograph of the club which is used to "finish off" wounded Italian soldiers. 32,000 of these were recently captured by the Italians.

The Destruction of Civilization

is in grim and sober reality what we are fighting this war to prevent. The club pictured above—from an actual official photograph—might be the weapon of a savage cave man of five thousand years ago. It is in fact the weapon with which German soldiers "finish off" enemy wounded who have fallen on the battlefield.

There is only one answer to make to such methods—the defeat of the German armies. America has taken up the sword to give that answer. Our army is in France to help win this war on the battlefield—that civilization may be safe, that America may be safe.

You Can Have Your Share in America's Answer to German Savagery

The Third Liberty Loan is your opportunity. It is the most direct blow that can be struck at German military supremacy. It is the most powerful aid that can be given our soldiers in France. It means rifles and helmets and gas-masks—the best protection for our men from German brutality. It means big guns and shells and airplanes—and VICTORY.

Invest today in bonds of the Third Liberty Loan, and save the lives of American soldiers.

Worth Fighting For?

SHALL this little girl grow up in the sort of American home we know, healthy and happy? Shall she have the advantage of living and learning in a free land, under free institutions? Shall such children develop into Liberty-loving citizens that a free America may be proud of?

For over two hundred years Americans have fought valiantly, and died gallantly, to win for themselves and hand down to their posterity the blessings of liberty, justice, self-government and equal opportunity. This precious heritage, bought at so great a price, is now threatened.

The question which today confronts America as a nation, and you as an individual, is whether or not a free America is worth fighting for

Are American children in this and all future generations to receive unimpaired the legacy of freedom of which we are now the custodians, or shall their country be turned over bodily to the brutal, rapacious, power-mad enemy which has forced us into this war?

This question cannot be answered by word of mouth, but by deeds alone.

Let your answer be your investment in

Liberty Bonds!

The 1st of May Thrift Stamp Day In The U. S. A.

The Active Co-operation of Every Reader of AUTOMOTIVE INDUSTRIES Is Urgently Requested To Make It A Success

May 1st, 1918, will be observed throughout the United States as Thrift Stamp Day! On that day retail stores everywhere in every line of business will ask customers to take **part of their change in Thrift Stamps!** It will be patriotic for every man, woman and child to accept at least one Thrift Stamp as change on every purchase made that day—and to make as many purchases as possible on May 1st.

Here is a big, practical way of getting millions of Thrift Stamps into the hands of the people of the United States, and of insuring the success of the Government's War Savings Stamps campaign. Thrift Stamp Day will **help everyone.** It will prove a tremendous boost to business. On May 1st, 1918, the nation should do the biggest total retail business of any single day in our history! The beneficial habit of Thrift will be sown broadcast among the citizens of the U. S. A.! Most important of all, Uncle Sam will be furnished with the sinews of War and Victory!

American business must go "over the top" **at once** in a quick drive to make Thrift Stamp Day an overwhelming success. You wholesalers, you jobbers, you salesmen, must **talk** Thrift Stamp Day among your trade, arouse the **enthusiasm** of the retailers, the storekeepers, the clerks behind the counters. Uncle Sam **needs your help.** A practical **plan** has been prepared showing how each one of you can "do your bit" to make Thrift Stamp Day a red letter day in American business annals. **Write** for this plan **today without fail.** Remember, in helping Uncle Sam you are helping business and helping yourself. Address Mr. W. Ward Smith, National War Savings Committee, 51 Chambers St., New York City.

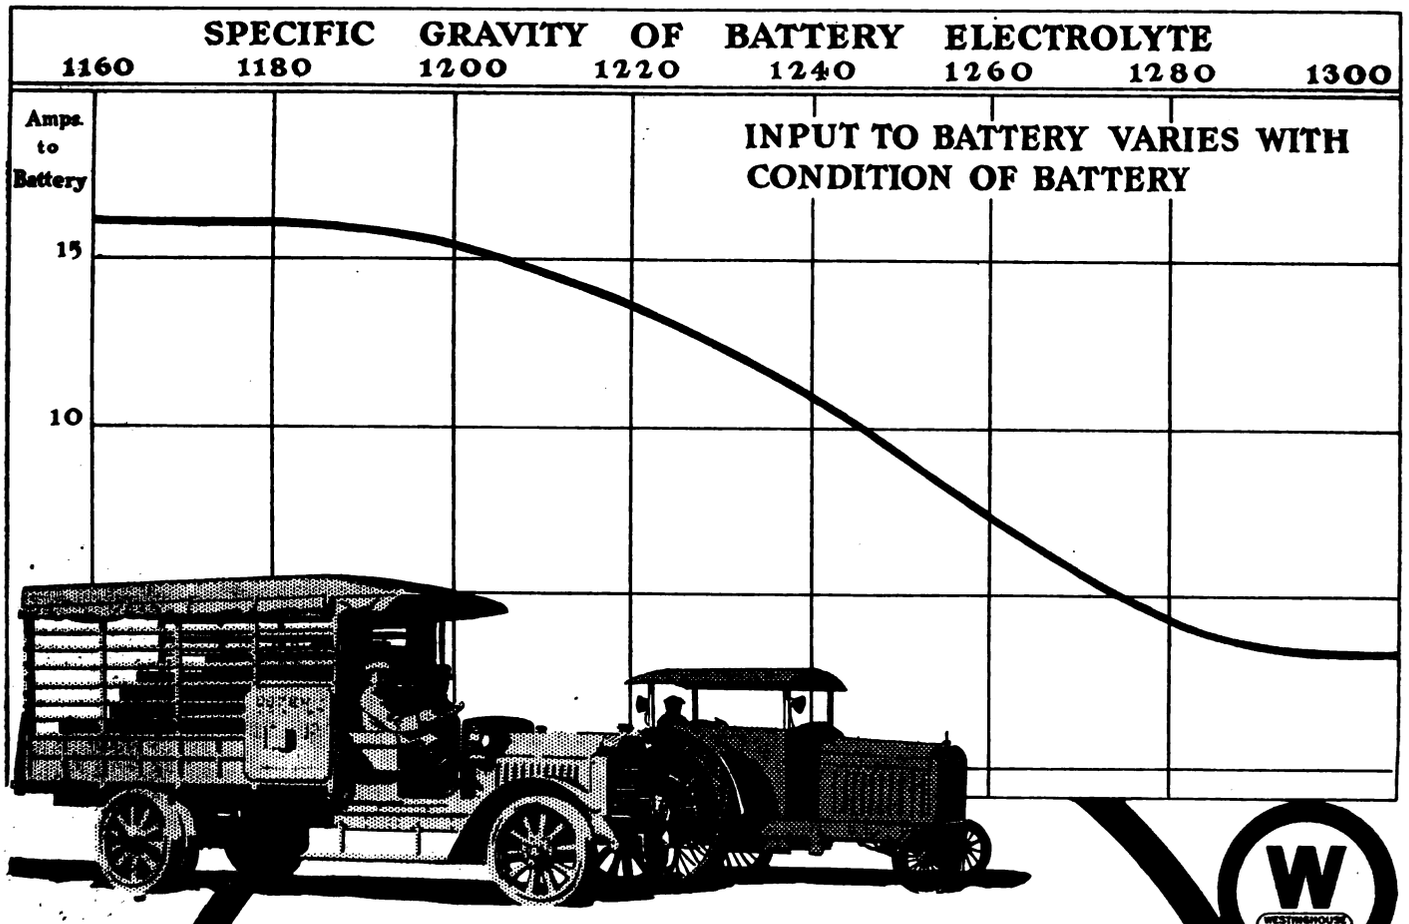
There's money in the Maxwell Truck. Thousands of dealers will divide millions of profits this coming year—get some of it.

Here's a truck that pays its way from day to day and, besides, earns back its cost within a year. Its repair bills are a joke—gas consumption, 16 miles to every gallon—a tire niggard—so easy to run and keep in order that boys and women can drive it with ease—a truck with all essential features of the $5000 five-ton leaders: worm drive, electric lights and generator included, which you can retail at $1085—several hundred dollars less than any other truck of similar capacity.

10-foot loading space, 2500 pounds in weight, but built so cunningly, so honestly, so brilliantly that freight which would stagger a brewery team won't feaze it. A sound pair of horses is more expensive to buy and far dearer to board.



Goes wherever a delivery wagon can travel, and travels where heavier trucks won't follow. Can be sold wherever there's a sign in sight. Little business can't afford to be without it and big operators would rather have a fleet of Maxwells than costly five-tonners which can't serve half so many purposes.

Secure the Maxwell truck agency and get the bank balance habit.

MAXWELL MOTOR COMPANY, Inc., DETROIT, MICH.

Maxwell

For Truck and Tractor

The task of producing a generator that will vary the current to suit the battery charge is one that calls for the highest electrical engineering ability. First of all, the natural tendency of generator voltage to increase with generator speed has to be overcome, for this is the only protection against burned-out lights and ruined battery.

In the Westinghouse Regulator Generator this tendency is so well overcome that voltage is held practically constant. Lamps burn at full brilliancy without danger of sudden burnout, and charging current drops off smoothly with charge, as shown in the above curve.

There are many other features of Westinghouse Regulator Generators that will interest not only makers of trucks and tractors, but manufacturers of high-class passenger cars who realize the size of the job that lighting and charging put up to the generator.

Cars That Run Well Are Half Sold

That is a reason why Maxwell sales have accelerated from 2,000 a year in 1912-13 to 100,000 for 1918.

And they have been so good that each year Maxwell dealers have laid by fortunes for rainy days.

Note these profits:

Maxwell dealers	MADE	*in 1913-1914 over*	$2,500,000
Maxwell dealers	MADE	*in 1914-1915 over*	$4,700,000
Maxwell dealers	MADE	*in 1915-1916 over*	$8,000,000
Maxwell dealers	MADE	*in 1916-1917 over*	$12,000,000

(In the last six months Maxwell dealers have made a proverbial killing on the Maxwell Truck.)

How much have you made?

Now is the getting-aboard time on Chalmers, for those Maxwell men and their plan which have put over Maxwell so big, are now running the Chalmers business. In two short months Chalmers sales have felt the leverage for they have spurted forward at a 200 per cent clip.

Better look into the Chalmers line before your business neighbor gets it.

THIS BLACKBOARD Lesson tells the story of Dohner Coupling production economy. More manufacturers and engineers are learning the lesson of Dohner economy every day, and through its use are enabled to cut down production costs. There is no getting away from the fact that the Dohner High Compression Coupling affords lower production cost, any more than there is any getting away from the fact that the Dohner coupling is the ONLY Leak Proof Coupling. Such facts as this are coming to our attention repeatedly:

Please mention Automotive Industries when writing to Advertisers

Digitized by Google

One Motor Car Company Has Cut $50,000 Annually Off Production Cost by Adopting Dohner High Compression Couplings

The Dohner Coupling is lighter. And it uses only about one-half the amount of brass used by the flared coupling, and costs about one-half as much. It has no washers. It requires no "flaring" and assembly work. A quick twist with a wrench or pliers only is required to tighten the coupling nut. Is it any wonder that the Dohner Coupling is saving one firm $50,000 a year and is saving far larger amounts for other companies?

IN FOUR YEARS, WITH 30,000,000 DOHNER COUPLINGS IN USE, NOT ONE REPORT OF LEAKAGE.

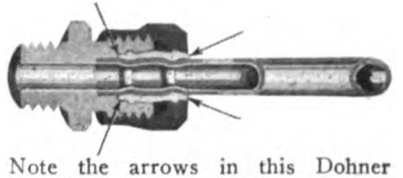
This remarkable fact is due to the Dohner design, which is according to correct, scientific principles. It consists of the main body of the coupling (brass) and the tapered nut (steel), and the tapered thimble (brass). The tubing slips through the main body of the nut and thimble into the body of the coupling up to the shoulder. The rings in the thimble "bite" into the tubing by compression, producing a practically welded joint.

The theory of the old fashioned flared coupling is wrong. It goes against scientific fact. The flaring operation stretches the tube and weakens it at the point where it must bear constant strain from vibration.

That's why 65% of flared couplings leak from the beginning and 80% eventually.

The Dohner Coupling is the only really effective coupling. Well engineered, efficiently produced motors, such as Maxwell and Buick, use Dohner Couplings exclusively. The Baldwin Locomotive Works is famous for careful engineering—after exhaustive tests it adopted the Dohner Coupling for its locomotives.

Dohner Couplings are particularly well adapted for aircraft because of their light weight, stability, quick reconnectability and efficiency. We will gladly supply further information on request. Note: The Dohner line is complete, including Unions, Ells, Tees, etc. Patented June 13, 1916.



THE OHIO METAL PRODUCTS COMPANY

Sales Office:
616 Free Press Bldg., DETROIT, MICH.

Factory:
DAYTON, O.

Note the arrow,—it points to a common cause of leakage in the flared coupling. 80% of *all* flared couplings eventually leak. In the flared coupling pictured, the flare is not a perfect fit. It leaves room for the escape of fluids. Note the amount of useless material in the flared coupling.

Note the arrows in this Dohner Coupling. They point to where the rings of the thimble are pressed into the tubing. Every Dohner Coupling is air-tight. In Baldwin locomotives they are used for the passage of live steam. Dohner Couplings will withstand far more pressure than any other kind. Note comparatively small amount of material.

The Dohner Coupling consists of the main body of the coupling, the tapered nut and the tapered thimble.

The rings are important. They "bite" into the tubing. Without the rings, the coupling would not be effective.

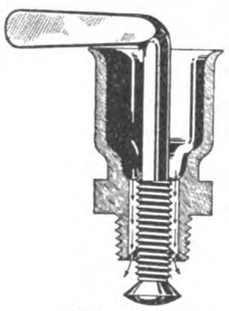
MORE THAN 3,000,000 BOSCH MAGNETOS IN USE

The Kant-Klog Primer

is rapidly being adopted as standard equipment by automobile builders because—

it is an innovation of efficiency and low cost—

it solves the problem of cold weather starting to the entire satisfaction of the user and can't clog with carbon because of its very construction.



The simplicity of the Kant-Klog Primer is seen in the sectional view. No part of the valve is exposed. There is plenty of clearance for the free flow of gasoline direct without waste when priming. There is no chance of carbon getting past and collecting on the seat. There is no need of removal even after months of non-use.

The more Kant-Klog is used the better its seating action.

Quotations on variations of our standard design to suit different type motors—promptly furnished.

Kant-Klog prices are surprisingly low.

Write today for particulars and free sample.

Note the Simple Construction

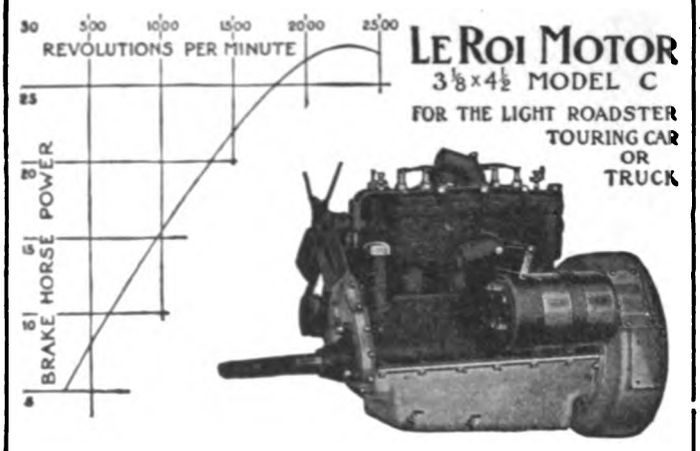
Wanted—Men

One of the largest and most substantial truck manufacturers in the country, located in the Middle West, is combing the field for two men to fill very important positions in its Sales Department. They are

Assistant to the Sales and Advertising Manager-and-Sales Engineer

The men who will be chosen must be of good personality and high calibre.



The former will have supervision over the advertising department and assist in sales correspondence. His duties will be many and varied.

The latter must be a transportation engineer—keen on construction and able to figure on the dollar and cents value basis. He, too, will have many duties thrust upon him.

Compensation will be liberal in each case. The future is measured only by each man's own ability.

The opportunity to associate yourself with a company of the highest standing in a capacity with an unlimited future, is an unusual one.

Your first letter must contain all information, including record, references and photograph. Don't forget to indicate which position you are interested in. Box S-M-T, care Automotive Industries, New York, N. Y.

Used by leading manufacturers of best-known American-made light trucks.

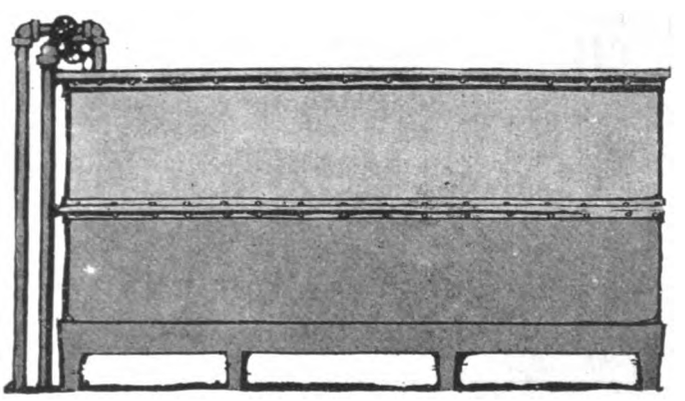
TANKS

Weapons of terrible destructiveness on the battle field.

Equally destructive of grease and oils in your cleaning department when filled with



OAKITE

None of the oily, greasy substances encountered in the cleaning tanks can withstand the action of OAKITE. It removes them all—surely, quickly and economically.

Make your tanks plough right through work as they have never done before. OAKITE is the only ammunition you need.

Results with OAKITE are guaranteed. Ask us about it. Write to-day!

Steel for Service

A gear breakdown always means a new gear secured from the storeroom or from the manufacturer, and a loss of time while the machine is idle.

Many manufacturers are using gears made from

Carnegie Rolled Steel Blanks

because severe industrial use has proven that they wear three to seven times as long as cast steel gears. If properly heat treated they never break.

Protect your gears against breakdowns.

DETROITER and BRIGGS-DETROITER
Motor Car Owners

NOTICE

During the past several months, owing to financial difficulties of the former management, there has been considerable confusion as to where Detroiter and Briggs-Detroiter repair orders should be sent.

With our acquisition of the Detroiter Motor Car Company, however, this condition is entirely overcome, and in the future all Detroiter and Briggs-Detroiter service will be given direct from our factory at Detroit. Therefore, to insure prompt attention and handling, repair orders and correspondence must be addressed (as before) to

Detroiter Motor Car Co.
584 Franklin St., Detroit, Mich.

PROPOSALS FOR INDIAN SUPPLIES.—Department of the Interior, Office of Indian Affairs, Washington, D. C., March 11, 1918. Sealed proposals, plainly marked on the outside of the sealed envelope: "Proposal for groceries" (or other class of supplies as the case may be), and addressed to the "Commissioner of Indian Affairs, U. S. Indian Warehouse, 308 South Green Street, Chicago, Ill," will be received until 10 o'clock a.m. on each of the following dates and on the class of supplies specified, and then opened: Dry goods, April 22, 1918; Underwear, hosiery, gloves, suspenders, hats and caps, April 26, 1918; Notions, April 29, 1918; Clothing and Piece goods, April 27, 1918; Groceries, April 19, 1918; Agricultural implements, wagons, etc., April 24, 1918; School books, etc., April 15, 1918; Chinaware, etc., April 17, 1918; Automobile supplies, April 15, 1918; Schedules covering all necessary information for bidders will be furnished upon application to the Indian Office, Washington, D. C., and to the U. S. Indian Warehouses at Chicago, St. Louis and San Francisco. The Department reserves the right to reject any or all bids or any part of any bid, and to post tentative awards promptly, subject to correction. CATO SELLS, Commissioner.

PATENT FOR SALE
On a New Shock Absorber
A thoroughly efficient device of few parts which can be easily and quickly attached to automobiles and trucks. In a most ingenious way it relieves the springs by cushioning both their upward and downward movements.
It is extremely simple and practicable, will give perfect service indefinitely and is easily accessible in every part.
With the proper facilities for manufacture this shock absorber can be produced at a very low figure and will find a ready and profitable market.
For sale by the Inventor

Manufacturers

Line Your Brakes with

ELEKTRA
ASBESTOS FRICTION

Your truck is judged by its every day performance, and in the process of this severe test the brake lining plays a mighty important part.

Remember, then, that in Elektra there is a certainty of dependability which, day in, day out, makes for the limit of service and satisfied customers.

Elektra is an interwoven fabric of asbestos and metal, chemically treated to combine the heat-proof qualities of asbestos with the high friction of an indestructible material. Made with the greatest care to exacting specifications.

AGATHON STEELS TRADE MARK

Physically, Agathon Steels are as near perfect as the most improved methods of steel making the world has ever known can make them.

But no small part of the credit for Agathon physical perfection belongs to the artisans who make Agathon Alloys.

These men, with the superlative Agathon standard ever in mind are keeping Agathon quality "away up there."

THE CENTRAL STEEL COMPANY
Massillon, Ohio

Branch Offices:

Detroit Office—326-27-28 Ford Bldg. F. Walter Guibert, District Representative.
Cleveland Office—Hickox Bldg. The Hamill-Hickox Company, District Representative.
Chicago Office—1370 People's Gas Bldg., 122 So. Michigan Blvd. C. H. Beach, District Sales Manager.
Philadelphia Office—603 Widener Bldg. Frank Wallace, District Sales Manager.
Syracuse Office—621 University Block. T. B. Davies, District Sales Manager.
J. E. Dockendorff & Co., 20 Broad St., New York, General Export Agents.

Ross Gears

THE merchant or manufacturer who knows and appreciates their superior quality in design, materials and workmanship, insists upon ROSS GEARS as steering equipment on the motor trucks that he buys. ¶He has every reason to believe that the motor truck manufacturer who has been willing to pay a little more to give his customers the added assurance of safety, reliability and easy steering that ROSS GEARS guarantee, has probably given the same careful thought to the entire make-up of his truck. ¶One hundred and fifteen different makes of motor trucks, representing considerably over half the industry, are steered by ROSS GEARS.

The Supreme Test of LONG Spiral Tubing

In the Tanks and War Trucks on the Battle Fronts of Europe, and in the Peace Trucks and Tractors on America's Highways and Farms where highest efficiency is demanded, Long Spiral Tubing has proved equal to every requirement

This type of construction is the most durable and dependable, and has made

LONG COOLING SYSTEMS

the recognized standard for these types of Motor power. Scientific investigation into the required service conditions, and the applying of exact engineering practice, has attained this perfected system of radiation.

Each Long Cooling System is especially designed for the motor with which it is to be used. Each step in creating the design is taken in co-operation between the Engineering Departments of our factory with those of the manufacturer.

Proper design insures proper construction. By reason of this co-operation we obtain minimum cost and maximum efficiency.

Long Cooling Systems are made in more than sixty different designs adapted to every type of motor vehicle, and are

Now Used by

28 MOTOR TRUCK MANUFACTURERS
19 MOTOR CAR MANUFACTURERS
16 TRACTOR MANUFACTURERS

Upon request we will gladly send our expert engineers to confer with any manufacturer relative to their radiator problem

22,500,000 Feet
of
Long Spiral Tubing
Annual Capacity
Enough to reach from New York to San Francisco

The Recognized STANDARD for MOTOR TRUCKS and TRACTORS
